Transforming growth factor-beta (TGF-beta) plays an important role in angiogenesis and vascular function. Endoglin, a transmembrane TGF-beta binding protein, is highly expressed on vascular endothelial cells and is the target gene for the hereditary haemorrhagic telangiectasia type I (HHT1), a dominantly inherited vascular disorder. The specific function of endoglin responsible for HHT1 is believed to involve alterations in TGF-beta responses. The initial interactions on the cell surface between endoglin and TGF-beta receptors may be an important mechanism by which endoglin modulates TGF-beta signalling, and thereby responses. On human microvascular endothelial cells, endoglin is co-expressed and is associated with betaglycan, a TGF-beta accessory receptor with which endoglin shares limited amino acid homology. This complex formation may occur in either a ligand-dependent or a ligand-independent manner. In addition, three higher order complexes containing endoglin, type II and/or type I TGF-beta receptors, also can occur on these cells. Thus endoglin may modify TGF-beta signalling by interacting with both betaglycan and the TGF-beta signalling receptors at physiological receptor concentrations and ratios ( Wong et al., 2000, Eur J Biochem vol. 267 : 5550-60).

Endoglin is a homodimeric membrane glycoprotein. In association with transforming growth factor (TGF)-ss receptors I and II, endoglin can also bind TGF-ss1 and -ss3 and form a functional receptor complex. In human vascular tissue, endoglin immunolabeling is shown to be higher in endarterectomy specimens removed from diseased coronary arteries than in normal internal mammary arteries. In vitro, antisense oligonucleotides to endoglin is shown to decrease its expression and antagonized the TGF-ss-mediated inhibition of human and porcine SMC migration. Thus, upregulation of endoglin occurs during arterial repair and in established atherosclerotic plaques and may be required for modulation of SMC migration by TGF-ss (Ma X et al., 2000, Arterioscler Thromb Vasc Biol vol. 20 :2546-52).

Hereditary hemorrhagic telangiectasia (HHT) is an inherited autosomal dominant vascular dysplasia caused by mutations in either endoglin (HHT1) or activin-like kinase receptor-1 (ALK-1) (HHT2). The majority of the mutations in endoglin cause frameshifts and

premature stop codons. Although initial reports suggested a dominant-negative model for HHT1, more recent reports have suggested that mutations in endoglin lead to haploinsufficiency. Expression of the missense mutants alone revealed that they are misfolded and that most show no cell surface expression. When co-expressed with wild-type endoglin, the missense mutants are able to dimerize with the normal endoglin protein and are trafficked to the cell surface. Thus either dominant-negative protein interactions or haploinsufficiency can cause HHT1 (Lux et al., 2000, Hum Mol Genet vol 9 : 745-55).

NOV68 is predicted to be expressed in at least the following tissues: adrenal gland, bone marrow, brain - amygdala, brain - cerebellum, brain - hippocampus, brain - substantia nigra, brain - thalamus, brain -whole, fetal brain, fetal kidney, fetal liver, fetal lung, heart, kidney, lymphoma - Raji, mammary gland, pancreas, pituitary gland, placenta, prostate, salivary gland, skeletal muscle, small intestine, spinal cord, spleen, stomach, testis, thyroid, trachea and uterus. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV68 is provided in Example 2.

The NOV68 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, the compositions of the present invention will have efficacy for the treatment of patients suffering from: arterial injuries, cerebral arteriovenous malformalities, pregnancy complications, carcinomas such as breast and mammary carcinoma as well as other diseases, disorders and conditions. The NOV68 nucleic acid encoding the endoglin-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed. The novel nucleic acid of the invention encoding a Endoglin (CD105 antigen)-like protein includes the nucleic acid whose sequence is provided in Table 68A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 68A while still encoding a protein that maintains its Endoglin (CD105 antigen)-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence disclosed in Table 68A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications

include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

5 In the mutant or variant nucleic acids, and their complements, up to about 0% of the bases may be so changed.

The novel protein of the invention includes the Endoglin (CD105 antigen)-like protein whose sequence is provided in Table 68B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 10 68B while still encoding a protein that maintains its Endoglin (CD105 antigen)-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 19% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic 15 methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV69

NOV69 includes two IL1-like proteins, designated herein as NOV69a and NOV69b. 20 These are splice variants of sequence accession number CG56950-01.

#### NOV69a

The disclosed NOV69a (alternatively referred to herein as CG56950-01) includes the 414 nucleotide sequence (SEQ ID NO: ) shown in Table 69A. A NOV69a ORF begins with a 25 Kozak consensus ATG initiation codon at nucleotides 100-102 and ends with a TGA codon at nucleotides 412-414. The disclosed NOV69a maps to human chromosome 7.

```

A NOV69a polypeptide (SEQ ID NO:238) encoded by SEQ ID NO:237 is 137 amino acids in length and is presented using the one-letter amino acid code in Table 69B. The Psort profile for NOV69a predicts that this sequence has no signal peptide and is likely to be localized to the cytoplasm with a certainty of 0.4500. In alternative embodiments, a NOV69a polypeptide is located to lysosomes with a certainty of 0.1514, or to peroxisomal microbodies with a certainty of 0.2384.

#### NOV69b

The disclosed NOV69b (alternatively referred to herein as CG56136-02) includes the 411 nucleotide sequence (SEQ ID NO: ) shown in Table 69C. A SEC2 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 1-3 and ends with a stop codon at nucleotides 409-411. The disclosed NOV69b maps to human chromosome 2q12-14.1.

A NOV69b polypeptide (SEQ ID NO:240) encoded by SEQ ID NO:239 is 136 amino acids in length and is presented using the one-letter amino acid code in Table 69D. The Psort profile for NOV69b predicts that this sequence has no signal peptide and is likely to be localized to the cytoplasm with a certainty of 0.6500. In alternative embodiments, a NOV69b polypeptide is located to lysosomes with a certainty of 0.2305.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 258 of 263 bases (98%) identical to a gb:GENBANK-ID:AF201831|acc:AF201831.1 mRNA from *Homo sapiens* (FIL1 epsilon mRNA). The full amino acid sequence of the protein of the invention was found to have 82 of 89 amino acid residues (92%) identical to, and 87 of 89 amino acid residues (97%) similar to, the 158 amino acid residue ptnr:SPTREMBL-ACC:Q9UHA7 protein from *Homo sapiens* (Human) (FIL1 EPSILON). NOV69 also has homology to the other proteins shown in the BLASTP data in Table 69F.

There are two structurally distinct forms of IL1: IL1(alpha), which is the acidic form with pI5, and IL1(beta) (IL1B; 147720), the neutral form with pI7. Both are 17-kD proteins coded by separate genes. The IL1A gene has 10,206 bp with 7 exons and 6 introns (Furutani et al., 1986). By Southern transfer analysis of DNAs from human-rodent somatic cell hybrids, Modi et al. (1988) assigned the IL1A gene to chromosome 2. Regional localization to 2q13-q21 was achieved by in situ hybridization. Lafage et al. (1989) confirmed assignment to 2q13 by in situ hybridization.

The IL1A and IL1B proteins, which are synthesized by a variety of cell types including activated macrophages, keratinocytes, stimulated B lymphocytes, and fibroblasts, are potent mediators of inflammation and immunity. Lord et al. (1991) demonstrated that both the alpha and beta forms, but particularly the beta form, are transcribed in polymorphonuclear leukocytes stimulated with LPS. Both IL1A and IL1B stimulate osteoclast activity in vitro and are potent bone resorbing factors. Sabatino et al. (1988) studied the effects of 72-hour subcutaneous infusions of interleukins 1-alpha and -beta on plasma, calcium, and bone morphology. Both interleukins 1 caused a marked, dose-dependent increase in plasma calcium. Increased numbers of osteoclasts and bone resorption surfaces were observed on quantitative histomorphometry of bone. The results suggest a role for IL1 in the modulation of extracellular fluid calcium homeostasis. Hogquist et al. (1991) demonstrated that interleukin-1 is involved in apoptosis (cell death). Both the alpha and the beta forms are released as a consequence of cell injury regardless of the insult.

Bailly et al. (1993) elucidated a polymorphism that consists of a variable number of repeats of a 46-bp sequence within intron 6 of the IL1A gene. Among 72 unrelated persons, they identified 6 different alleles ranging from 5 to 18 repeats; the most frequent allele, present in 62%, contained 9 repeats. They suggested that the polymorphism may be of significance in gene function, since each repeat contains 3 potential binding sites for transcription factors.

Gray et al. (1986) showed that in the mouse also there are at least 2 interleukin-1 genes, *Il1(alpha)* and *Il1(beta)*. Boulton et al. (1989) used in situ chromosome hybridization to show that the 2 *Il1* genes in the mouse are located in the F region of chromosome 2. It had previously been shown by studies in mouse-hamster somatic cell hybrids and in recombinant inbred strains that the 2 genes are tightly linked on murine chromosome 2, approximately 4.7 cM distal to beta-2-microglobulin. By pulsed field gel electrophoresis, Silver et al. (1990) showed that the mouse *Il1a* and *Il1b* genes are contained in a genomic fragment of about 70 kb. Further studies suggested that *Il1b* lies 5-prime to *Il1a*, that the 2 genes are oriented in the same direction, and that they are separated by about 50 kb. From restriction mapping of the human genomic region, Nicklin et al. (1994) concluded that, relative to one terminal CpG island, the 3 genes mapped to the following intervals: *IL1A* was between +0 and +35 kb, *IL1B* between +70 and +110 kb, and *IL1RN* (147679) between +330 and +430 kb. Since the assignment of *IL1RN* to 2q14.2 appears to be the most definitive localization, the *IL1A* and *IL1B* genes can be presumably be said to be also on 2q14. Cox et al. (1998) carried out studies with multiallelic markers that grouped the 3 genes into a biallelic system for use in association studies. They identified a common, 8-locus haplotype of the *IL1* gene cluster.

Hurwitz et al. (1992) studied the role of *IL1* in the ovary, using a solution hybridization/RNase protection assay to test for expression of the *IL1* gene, its type I receptor (*IL1R*; 147810), and its receptor antagonist (*IL1RN*). They presented findings which, taken together, revealed the existence of a complete, highly compartmentalized, hormone-dependent intraovarian *IL1* system.

Since *IL1* is an important cytokine in the control of the inflammatory response central to the pathology of rheumatoid arthritis (180300), Cox et al. (1999) used the combined sib-TDT (transmission/disequilibrium test) and TDT, in addition to parametric and nonparametric linkage methods, to investigate candidate genes of the *IL1* gene cluster in the 2q13 region. Several tightly linked *IL1* cluster markers yielded suggestive evidence for linkage in the combined TDT in those families in which affected sibs did not share 2 HLA-DRB1 alleles identical by descent. The evidence was significant in those with severe disease, as assessed by the presence of bone erosions. In contrast, there was no evidence of linkage using nonparametric linkage analysis, but parametric analysis revealed weak evidence of linkage when marker-trait disequilibrium was incorporated into the analysis. The data provided preliminary evidence for linkage of genes of the *IL1* cluster to rheumatoid arthritis and suggested a possible role for this region in severe erosive disease.

Kornman et al. (1997) suggested that genetic polymorphisms of the IL1A and IL1B genes may be associated with severity of periodontitis in adult nonsmokers. The IL1B polymorphism was referred to as IL1B+3953 and the IL1A polymorphism was referred to as IL1A-889. Nonsmokers aged 40 to 60 carrying the '2' allele (in either homozygous or heterozygous state) at both loci were observed to have nearly 19 times the risk of developing severe periodontitis compared to subjects homozygous for the '1' allele at either or both of these loci. Because of the implication of interleukin-1 in adult periodontitis, Diehl et al. (1999) undertook an evaluation of the role of these IL1A and IL1B polymorphisms in early-onset periodontitis (EOP; see 170650) in 28 African-American families and 7 Caucasian-American families with 2 or more affected members. The 2 major EOP subtypes, localized juvenile periodontitis and generalized early-onset periodontitis, encompassing rapidly progressive periodontitis and generalized juvenile periodontitis, were analyzed separately and together. They obtained highly significant evidence of linkage disequilibrium for both groups of generalized EOP subjects. A similar trend was noted for the localized form. The IL1 alleles associated with high risk of EOP had been suggested previously to be correlated with low risk for severe adult periodontitis. Linkage disequilibrium with generalized EOP was equally strong for smoking and nonsmoking subjects. IL1A and IL1B polymorphisms were in strong linkage disequilibrium with each other in Caucasians but not in African Americans. Haplotype analyses evaluating both polymorphisms simultaneously indicated that the IL1B variant is likely to be more important for EOP risk. Sib pair linkage analyses, by contrast, provided only marginal support for a gene of very major effect on EOP risk attributable to these IL1 polymorphisms. Diehl et al. (1999) interpreted their results as indicating that EOP is a complex, oligogenic disorder, with interleukin-1 genetic variation contributing an important but not exclusive influence on disease risk.

NOV69 is predicted to be expressed in at least the following tissues: spleen, lymph node, thymus, tonsil and leukocyte tissues. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV69 is provided in Example 2.

The NOV69 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, the compositions of the present invention will have efficacy for the treatment of patients suffering from: inflammatory and immune system-related diseases such as rheumatoid arthritis and inflammatory bowel disease, periodontitis, hypothyroidism, congenital, due to thyroid

dysgenesis or hypoplasia; osteoarthritis of distal interphalangeal joints; selective T-cell defect; nephronophthisis, juvenile; purpura fulminans, neonatal; susceptibility to infections such as viral and bacterial; thrombophilia due to protein C deficiency; as well as other diseases, disorders and conditions.

5           The NOV69 nucleic acid encoding the IL1-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed. The novel nucleic acid of the invention encoding a Interleukin 1 epsilon-like protein includes the nucleic acid whose sequence is provided in Table 69A or 69C, or a fragment thereof. The invention also includes a mutant or  
10       variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 69A or 69C while still encoding a protein that maintains its Interleukin 1 epsilon-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 69A or 69C, including nucleic acid fragments that are complementary to any of the nucleic  
15       acids just described.

          The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least  
20       in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 2% of the bases may be so changed.

          These materials are further useful in the generation of antibodies that bind  
25       immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV70

30       NOV70 includes two OS9-like proteins, designated herein as NOV70a and NOV70b.

#### NOV70a

The disclosed NOV70a (alternatively referred to herein as CG56878-01) includes the 2739 nucleotide sequence (SEQ ID NO:241) shown in Table 70A. A NOV70a ORF begins with a Kozak consensus ATG initiation codon at nucleotides 86-88 and ends with a stop codon at nucleotides 2090-2092. The disclosed NOV70a maps to human chromosome 12q13.

A NOV70a polypeptide (SEQ ID NO:242) encoded by SEQ ID NO:241 is 668 amino acids in length and is presented using the one-letter amino acid code in Table 70B. The Psort profile for NOV70a predicts that this sequence has a signal peptide and is likely to be

10 localized outside the cell with a certainty of 0.8200. In alternative embodiments, a NOV70a

polypeptide is located in the nucleus with a certainty of 0.1260. The Signal P predicts a likely cleavage site for a NOV70a peptide is between positions 25 and 26, *i.e.*, at the dash in the sequence SLT-GG.

#### NOV70b

The disclosed NOV70b (alternatively referred to herein as CG56868-04) includes the 2702 nucleotide sequence (SEQ ID NO: ) shown in Table 70C. A SEC2 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 86-88 and ends with a TGA codon at 10 nucleotides 2036-2038. The disclosed NOV70b maps to human chromosome 12q13.

10

A BLAST analysis of NOV70 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV70 had high homology to other proteins as shown in Table 70E.

15

**Table 70E. BLASTX results from PatP database for NOV70**

| Smallest<br>Sum<br>High. Probability |
|--------------------------------------|
|--------------------------------------|

| Sequences producing High-scoring Segment Pairs:     | Score | P(N)    |
|-----------------------------------------------------|-------|---------|
| patp:AAG76089 Human colon cancer antigen protein    | 423   | 3.4e-52 |
| patp:AAG41826 Arabidopsis thaliana protein fragment | 298   | 2.6e-25 |
| patp:AAG41827 Arabidopsis thaliana protein fragment | 279   | 2.9e-23 |
| patp:AAG41828 Arabidopsis thaliana protein fragment | 279   | 2.9e-23 |
| patp:AAU32255 Novel human secreted protein #2746    | 232   | 3.4e-18 |

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 2735 of 2739 bases (99%) identical to a gb:GENBANK-ID:HSU41635|acc:U41635.1 mRNA from *Homo sapiens* (Human OS-9 precursor mRNA, complete cds). The full amino acid sequence of the protein of the invention was found to have 667 of 668 amino acid residues (99%) identical to, and 667 of 668 amino acid residues (99%) similar to, the 667 amino acid residue ptrn:SWISSPROT-ACC:Q13438 protein from *Homo sapiens* (Human) (PROTEIN OS-9 PRECURSOR). The sequence of this invention has 1 amino acid insertion, compared to ptrn:SWISSPROT-ACC:Q13438 protein from *Homo sapiens* (Human) (PROTEIN OS-9 PRECURSOR). NOV70 also has homology to the other proteins shown in the BLASTP data in Table 70F.

Amplification and overexpression of genes involved in cellular growth control occur frequently in human tumors. Using a chromosome microdissection-based hybrid-selection

strategy, the OS-9 gene has been identified within 12q13-15, a region frequently amplified in human cancers. The full-length OS-9 cDNA sequence consists of 2785 bp from which an open reading frame (ORF) with 667 amino-acid residues has been deduced. The predicted polypeptide is water soluble and acidic. The OS-9 gene encodes a 2.8-kb mRNA transcribed in all 16 human tissues examined, suggesting that OS-9 is ubiquitously expressed in human tissues. OS-9 is co-amplified with CDK4 in three of five sarcoma tissues. Homology analysis of the amino-acid sequence has revealed significant similarities between OS-9 and two ORFs deduced from genomic sequences in *Caenorhabditis elegans* and *Saccharomyces cerevisiae*. The region of similarity extends over 200 residues (approximately one-third of each ORF), and eight cysteines were conserved in all three ORFs. These observations suggest that this region comprises a functional domain present in a novel evolutionarily conserved gene family defined by OS-9.

The OS-9 genomic DNA has been isolated and characterized from a human BAC library. Sequencing of the genomic DNA has shown that the gene spanned approximately 30.4 kbp and had 15 exons. The 1,010 bp sequence of the 5' upstream region has also been determined. The potential binding-sequence motifs TATA and CCAAT for general transcription factors have been found in the 5' upstream region. Primer extension analysis has revealed two putative transcription start sites.

Three isoforms of OS-9 cDNA have been isolated from a myeloid leukemia HL-60 cDNA library and characterized. Isoform 1 consisted of 2,700 bp, from which a 667 amino acid sequence was deduced and found to be identical with that of OS-9 cDNA from osteosarcoma cells. Isoform 2 cDNA lacked a 165 nucleotide sequence in the coding region. Isoform 3 cDNA had an additional 45 bp deletion in the coding region. Isoforms 2 and 3 encode 612 and 597 amino acid polypeptides, respectively. Comparison of their cDNA sequences with the genomic structure has indicated that three isoforms are splice variants. Reverse transcription-polymerase chain reaction analysis has shown predominant expression of isoform 2 mRNA in myeloid leukemia HL-60 cells, osteosarcoma OsA-CL cells and rhabdomyosarcoma Rh30 cells. Northern blotting has revealed similar levels of expression of OS-9 gene in various tumor cell lines of sarcoma cells, carcinoma cells and myeloid leukemia cells, but 3-4 times higher expression in OsA-CL cells and Rh30 cells containing a homogeneously staining region of 12q13-15. OS-9 expression decreased in differentiation-induced HL-60 cells. The above data suggests a possible involvement of OS-9 in cell growth and tumour development.

The NOV70 disclosed in this invention is predicted to be expressed in at least the following tissues: adrenal gland, bone marrow, brain - amygdala, brain - cerebellum, brain - hippocampus, brain - substantia nigra, brain - thalamus, brain -whole, fetal brain, fetal kidney, fetal liver, fetal lung, heart, kidney, lymphoma - Raji, mammary gland, pancreas, pituitary gland, placenta, prostate, salivary gland, skeletal muscle, small intestine, spinal cord, spleen, stomach, testis, thyroid, trachea, uterus, amnion, aorta, ascending colon, bone, bronchus, cartilage, cervix, colon, cornea, coronary artery, dermis, duodenum, epidermis, epididymis, hair follicles, hypothalamus, islets of langerhans, kidney cortex, liver, lung, lymph node, lymphoid tissue, esophagus, ovary, parathyroid gland, peripheral blood, pineal gland, respiratory bronchiole, retina, skin, thymus, tonsils, umbilical vein, urinary bladder, vulva, whole organism. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV70 is provided in Example 2.

The NOV70 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, the compositions of the present invention may have efficacy for the treatment of patients suffering from leukemias, sarcomas and other types of cancer, as well as other diseases, disorders and conditions. OS-9 was co-amplified with CDK4 in three of five sarcoma tissues (Mol Carcinog 1996 Apr;15(4):270-5). Three isoforms of OS-9 cDNA were found in a myeloid leukemia HL-60 cDNA library and reverse transcription-polymerase chain reaction analysis has shown predominant expression of isoform 2 mRNA in myeloid leukemia HL-60 cells, osteosarcoma OsA-CL cells and rhabdomyosarcoma Rh30 cells. Northern blotting has revealed similar levels of expression of OS-9 gene in various tumor cell lines of sarcoma cells, carcinoma cells and myeloid leukemia cells (J Biochem (Tokyo) 1998 May;123(5):876-82).

The NOV70 nucleic acid encoding the OS-9-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed. The novel nucleic acid of the invention encoding a OS-9-like protein includes the nucleic acid whose sequence is provided in 70A or 70C, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in 70A or 70C while still encoding a protein that maintains its OS-9-like activities and physiological functions, or a fragment of such a nucleic acid.

The invention further includes nucleic acids whose sequences are complementary to the sequence of 70A or 70C, including nucleic acid fragments that are complementary to any of the nucleic acids just described. The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications.

5 Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to  
10 about 1% of the bases may be so changed.

The novel protein of the invention includes the OS-9-like protein whose sequence is provided in Table 70B or 70D. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 70B or 70D while still encoding a protein that maintains its OS-9-like activities and physiological  
15 functions, or a functional fragment thereof. In the mutant or variant protein, up to about 1% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using  
20 prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV71

The disclosed NOV71 (alternatively referred to herein as CG56906-01) includes the  
25 2081 nucleotide sequence (SEQ ID NO:245) shown in Table 71A. A NOV71 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 55-57 and ends with a stop codon at nucleotides 1978-1980. The disclosed NOV71 maps to human chromosome Xp11.

A NOV71 polypeptide (SEQ ID NO:246) encoded by SEQ ID NO:245 is 641 amino acids in length and is presented using the one-letter amino acid code in Table 71B. The Psort profile for NOV71 predicts that this sequence is likely to be a Type III 6 membrane protein, has a signal peptide, and is likely to be localized to the plasma membrane with a certainty of 0.8200. In alternative embodiments, a NOV71 polypeptide is located to Golgibodies with a certainty of 0.4600, or to the endoplasmic reticulum (membrane) with a certainty of 0.6850. The Signal P predicts a likely cleavage site for a NOV71 peptide is between positions 37 and 38, *i.e.*, at the dash in the sequence IWL-FK.

A BLAST analysis of NOV71 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV71 had high homology to other proteins as shown in Table 71C.

Table 71C. BLASTX results from PatP database for NOV71

| Sequences producing High-scoring Segment Pairs:                 | High Score | Smallest Sum     |
|-----------------------------------------------------------------|------------|------------------|
|                                                                 |            | Probability P(N) |

- In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 747 of 1121 bases (66%) identical to a gb:GENBANK-ID:AF030409|acc:AF030409.1 mRNA from *Homo sapiens* (sodium-hydrogen exchanger 6 (NHE-6) mRNA, nuclear gene encoding mitochondrial protein). The full amino acid sequence of the protein of the invention was found to have 391 of 518 amino acid residues (75%) identical to, and 443 of 518 amino acid residues (85%) similar to, the 669 amino acid residue ptmr:SWISSNEW-ACC:Q92581 protein from *Homo sapiens* (Human) (SODIUM/HYDROGEN EXCHANGER 6 (NA(+)/H(+)) EXCHANGER 6) (NHE-6)).
- NOV71 also has homology to the other proteins shown in the BLASTP data in Table 71D.

Table 71D. NOV71 BLASTP results

This BLASTP data is displayed graphically in the ClustalW in Table 71E. A multiple sequence alignment is given, with the NOV71 protein being shown on line 1 in a ClustalW analysis comparing the protein of the invention with the related protein sequences shown in Table 71D.

Table 71F lists the domain description from DOMAIN analysis results against NOV71. This indicates that the NOV71 sequence has properties similar to those of other proteins known to contain this domain.

5

| <p>gnl Pfam pfam00999, Na_H_Exchanger, Sodium/hydrogen exchanger family. Na/H antiporters are key transporters in maintaining the pH of actively metabolizing cells. The molecular mechanisms of antiport are unclear. These antiporters contain 10-12 transmembrane regions (M) at the amino-terminus and a large cytoplasmic region at the carboxyl terminus. The transmembrane regions M3-M12 share identity with other members of the family. The M6 and M7 regions are highly conserved. Thus, this is thought to be the region that is involved in the transport of sodium and hydrogen ions. The cytoplasmic region has little similarity throughout the family. SEQ ID NO:865</p> <p>CD-Length = 400 residues, 88.5% aligned<br/>Score = 276 bits (706), Expect = 3e-75</p> |     |                                                               |     |  |

Na<sup>+</sup>/H<sup>+</sup> exchangers are integral membrane ion transporter proteins that exchange extracellular Na<sup>+</sup> for intracellular H<sup>+</sup> with a stoichiometry of one for one. They have multiple cellular functions, including maintenance of intracellular pH, cell volume control, and reabsorption of sodium across renal, intestinal, and other epithelia. Multiple Na<sup>+</sup>/H<sup>+</sup> exchanger isoforms (NHE1-NHE6) exist, exhibiting considerable differences in their

membrane localization, biochemical and pharmacologic properties, and responsiveness to various stimuli. For example, NHE1, the most predominant isoform expressed in heart, contributes significantly to myocardial intracellular pH. Hyperactivation of NHE1 during episodes of cardiac ischemia and reperfusion has been shown to disrupt the intracellular ion  
5 balance, leading to cardiac dysfunction and damage in several animal models, which can be prevented by pharmacological antagonists of NHEH. Increased activity of sodium/hydrogen exchange also provides a potentially important mechanism for the development of hypertension.

In 1998, Numata et al. identified the gene encoding a novel isoform of  
10 sodium/hydrogen exchanger that they called NHE6 or SLC9A6 (3). The NHE6 protein has similar topology to the other NHEs in that it has 12 putative membrane-spanning segments within the N-terminal region and a hydrophilic C terminus. However, NHE6 also has a putative mitochondrial inner membrane-targeting signal at its N terminus. The NOV71 protein is homologous to the NHE6 protein, except that it is predicted to localize to the plasma  
15 membrane instead of the mitochondrial inner membrane. The NHE6-like gene maps to human chromosome Xp11. Based on its expression pattern, NOV71 may play a role in renal or metabolic diseases and immune function through its sodium/hydrogen exchange activity at the plasma membrane.

NOV71 is predicted to be expressed in at least the following tissues: kidney, tonsils,  
20 germinal B cells, uterus, pituitary gland, brain, skeletal muscle, heart, lung, liver, pancreas, small intestine, colon, kidney, spleen, thymus, peripheral blood leukocytes, testis, ovary, placenta and prostate. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for  
25 NOV71 is provided in Example 2.

The NOV71 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, cancer, trauma, bacterial and viral infections, in vitro and in vivo regeneration, endometriosis, fertility, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies,  
30 graft versus host disease, diabetes, autoimmune disease, renal artery stenosis, interstitial nephritis, glomerulonephritis, polycystic kidney disease, systemic lupus erythematosus, renal tubular acidosis, IgA nephropathy, hypercalcaemia, Lesch-Nyhan syndrome, endocrine dysfunctions, diabetes, obesity, growth and reproductive disorders, tonsillitis as well as other diseases, disorders and conditions.

The NOV71 nucleic acids encoding the sodium/hydrogen exchanger NHE6-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed. The novel nucleic acid of the invention encoding a Sodium/Hydrogen Exchanger 6-like protein includes the nucleic acid whose sequence is provided in Table 71A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 71A while still encoding a protein that maintains its Sodium/Hydrogen Exchanger 6-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 71A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 34% of the bases may be so changed.

The novel protein of the invention includes the Sodium/Hydrogen Exchanger 6-like protein whose sequence is provided in Table 71B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 71B while still encoding a protein that maintains its Sodium/Hydrogen Exchanger 6-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 25% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

## NOV72

The disclosed NOV72 (alternatively referred to herein as CG56910-01) includes the 1094 nucleotide sequence (SEQ ID NO:247) shown in Table 72A. A NOV72 ORF begins

Kozak consensus ATG initiation codon at nucleotides 14-16 and ends with a stop codon at nucleotides 1082-1084. The disclosed NOV72 maps to human chromosome 6.

- 5 A NOV72 polypeptide (SEQ ID NO:248) encoded by SEQ ID NO:247 is 356 amino acids in length and is presented using the one-letter amino acid code in Table 72B. The Psort profile for NOV72 predicts that this sequence has no signal peptide and is likely to be localized in the cytoplasm with a certainty of 0.5050. In alternative embodiments, a NOV72 polypeptide is located to lysosomes with a certainty of 0.1000, to the mitochondrial matrix space with a certainty of 0.1000, or to paroxisomal microbodies with a certainty of 0.3547.

- A BLAST analysis of NOV72 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV72 had high
- 15 homology to other proteins as shown in Table 72C.

**Table 72C. BLASTX results from PatP database for NOV72**

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 215 of 342 bases (62%) identical to a gb:GENBANK-ID:AF073344|acc:AF073344.1 mRNA from *Homo sapiens* (ubiquitin-specific protease 3 (USP3) mRNA). The full amino acid sequence of the protein of the invention was found to have 124 of 345 amino acid residues (35%) identical to, and 183 of 345 amino acid residues (53%) similar to, the 353 amino acid residue ptmr:SWISSNEW-ACC:O88623 protein from *Mus musculus* (Mouse) (UBIQUITIN CARBOXYL-TERMINAL HYDROLASE 2 (EC 3.1.2.15) (UBIQUITIN THIOLESTERASE 2) (UBIQUITIN-SPECIFIC PROCESSING PROTEASE 2) (DEUBIQUITINATING ENZYME 2) (41 KDA UBIQUITIN-SPECIFIC PROTEASE)). NOV72 also has homology to the other proteins shown in the BLASTP data in Table 72D.

Ubiquitin is a highly conserved 76-amino acid protein involved in the regulation of intracellular protein breakdown, cell cycle regulation, and stress response. Ubiquitin is released from degraded proteins by disassembly of the polyubiquitin chains, which is mediated by ubiquitin-specific proteases (USPs). The ubiquitin-specific proteases are a family of largely dissimilar enzymes with two major conserved sequence regions, containing either a conserved cysteine residue or two conserved histidine residues, respectively. The murine Unp oncoprotein and its human homologue, Unph, both contain regions similar to the conserved Cys and His boxes common to all the Ubps.

Unp and Unph have been shown to be active deubiquitinating enzymes, able to cleave ubiquitin from both natural and engineered linear ubiquitin-protein fusions, including the polyubiquitin precursor. Mutation of the conserved Unp Cys and His residues abolishes this activity, and identifies the likely His residue in the catalytic triad. Unp is tumorigenic when overexpressed in mice, leading to the suggestion that Unp may play a role in the regulation of ubiquitin-dependent protein degradation. It was demonstrated that the high-level expression of Unp in yeast does not disrupt the degradation of the N-end rule substrate Tyr-beta-

galactosidase (betagal), the non-N-end rule substrate ubiquitin-Pro-betagal, or the degradation of abnormal, canavanine-containing proteins.

Data suggests that Unp is not a general modulator of ubiquitin-dependent proteolysis. However, Unp may have a role in the regulation of the degradation of a specific, as yet  
5 undescribed, substrate(s). The novel human Ubiquitin-Specific Protease-like Proteins of the invention contains two Ubiquitin carboxyl-terminal hydrolase domains. Therefore, it is anticipated that NOV72 has a role in regulation of specific ubiquitins and could be a potentially important target for drugs. Such drugs may have important therapeutic applications, such as treating numerous tumors.

10 NOV72 is predicted to be expressed in at least the following tissues: bladder and cervix. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV72 is provided in Example 2.

15 The NOV72 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, the compositions of the present invention will have efficacy for the treatment of patients suffering from: cystitis, incontinence, fertility, systemic lupus erythematosus, autoimmune disease, asthma, emphysema, scleroderma, allergy, ARDS, Von Hippel-Lindau (VHL) syndrome,  
20 Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neurodegeneration. as well as other diseases, disorders and conditions. The NOV72 nucleic acid encoding the ubiquitin specific protease-like protein of the invention, or fragments  
25 thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a ubiquitin-specific protease-like protein includes the nucleic acid whose sequence is provided in Table 72A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may  
30 be changed from the corresponding base shown in Table 72A while still encoding a protein that maintains its ubiquitin-specific protease-like activities and physiological functions, or a fragment of such a nucleic acid.

The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 72A, including nucleic acid fragments that are complementary to any of

the nucleic acids just described. The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 38% of the bases may be so changed.

The novel protein of the invention includes the ubiquitin-specific protease-like protein whose sequence is provided in Table 72B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 72B while still encoding a protein that maintains its ubiquitin-specific protease-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 65% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV73

The disclosed NOV73 (alternatively referred to herein as CG56822-01) includes the 967 nucleotide sequence (SEQ ID NO:249) shown in Table 73A. A NOV73 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 26-28 and ends with a stop codon at nucleotides 935-937. The disclosed NOV73 maps to human chromosome 2.

A NOV73 polypeptide (SEQ ID NO:250) encoded by SEQ ID NO:249 is 303 amino acids in length and is presented using the one-letter amino acid code in Table 73B. The Psort profile for NOV73 predicts that this sequence has no signal peptide and is likely to be localized to peroxisomal microbodies with a certainty of 0.7480. In alternative embodiments, a NOV73 polypeptide is located to lysosomes with a certainty of 0.1000, or to the mitochondrial matrix space with a certainty of 0.1000.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 427 of 643 bases (66%) identical to a gb:GENBANK-ID:AF033189|acc:AF033189.1 mRNA from Gallus gallus (Gallus gallus sulfotransferase mRNA). The full amino acid sequence of the protein of the invention was found to have 151 of 307 amino acid residues (49%) identical to, and 212 of 307 amino acid residues (69%) similar to, the 312 amino acid residue ptrn:SPTREMBL-ACC:O57338 protein from Gallus

gallus (Chicken) (SULFOTRANSFERASE). NOV73 also has homology to the other proteins shown in the BLASTP data in Table 73D.

This family includes a range of sulfotransferase proteins including flavonyl 3-sulfotransferase, aryl sulfotransferase, alcohol sulfotransferase, estrogen sulfotransferase and phenol-sulfating phenol sulfotransferase. These enzymes are responsible for the transfer of sulphate groups to specific compounds.

NOV73 is predicted to be expressed in at least the following tissues: epithelial, endothelial, muscle, and neuronal tissues. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV73 is provided in Example 2.

The novel nucleic acid of the invention encoding a sulfotransferase-like protein includes the nucleic acid whose sequence is provided in Table 73A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 73A while still encoding a protein that maintains its sulfotransferase-like activities and physiological functions, or a fragment of such a nucleic acid.

The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 73A, including nucleic acid fragments that are complementary to any of the nucleic acids just described. The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 34% of the bases may be so changed.

The novel protein of the invention includes the Sulfotransferase-like protein whose sequence is provided in Table 73B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 73B while

still encoding a protein that maintains its Sulfotransferase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 51% of the amino acid residues may be so changed.

The NOV73 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, the compositions of the present invention will have efficacy for the treatment of patients suffering from: cystitis, incontinence, fertility, systemic lupus erythematosus, autoimmune disease, asthma, emphysema, scleroderma, allergy, ARDS, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neurodegeneration. as well as other diseases, disorders and conditions. The NOV73 nucleic acid encoding the sulfotransferase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV74

The disclosed NOV74 (alternatively referred to herein as CG56775-01) includes the 732 nucleotide sequence (SEQ ID NO:251) shown in Table 74A. A NOV74 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 52-54 and ends with a stop codon at nucleotides 673-675. The disclosed NOV74 maps to human chromosome 15.

A NOV74 polypeptide (SEQ ID NO:252) encoded by SEQ ID NO:251 is 214 amino acids in length and is presented using the one-letter amino acid code in Table 74B. The Psort profile for NOV74 predicts that this sequence has no signal peptide, and is likely to be localized at the cytoplasm with a certainty of 0.4500. In alternative embodiments, a NOV74 polypeptide is located to peroxisomal microbodies with a certainty of 0.3625, or, to the mitochondrial matrix space with a certainty of 0.1000.

A BLAST analysis of NOV74 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV74 had high homology to other proteins as shown in Table 74C.

**Table 74C. BLASTX results from PatP database for NOV74**

| Sequences producing High-scoring Segment Pairs:                     | High Score | Smallest Sum Probability P(N) |

| patp:AAG67628 Amino acid sequence of a human protein                | 664        | 5.4e-65                       |

In a search of public sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 347 of 420 bases (82%) identical to a gb:GENBANK-ID:HUMDSPHS|acc:L05147.1 mRNA from *Homo sapiens* (Human dual specificity phosphatase tyrosine/serine mRNA). The full amino acid sequence of the protein of the invention was found to have 135 of 185 amino acid residues (72%) identical to, and 150 of 185 amino acid residues (81%) similar to, the 185 amino acid residue ptmr:SWISSNEW-ACC:P51452 protein from *Homo sapiens* (Human) (DUAL SPECIFICITY PROTEIN PHOSPHATASE 3 (EC 3.1.3.48) (EC 3.1.3.16) (DUAL SPECIFICITY PROTEIN PHOSPHATASE VHR)). NOV74 also has homology to the other proteins shown in the BLASTP data in Table 74D.

Mitogen-activated protein (MAP) kinase phosphatases constitute a growing family of dual specificity phosphatases thought to play a role in the dephosphorylation and inactivation of MAP kinases and are therefore likely to be important in the regulation of diverse cellular processes such as proliferation, differentiation, and apoptosis. For this reason it has been suggested that MAP kinase phosphatases may be tumor suppressors. DUSP6 (alias PYST1), one of the dual-specificity tyrosine phosphatases, is localized on 12q21, one of the regions of frequent allelic loss in pancreatic cancer. This gene is composed of three exons, and two forms of alternatively spliced transcripts are ubiquitously expressed. Although no mutations were observed in 26 pancreatic cancer cell lines, reduced expressions of the full-length transcripts were observed in some cell lines, which may suggest some role for DUSP6 in pancreatic carcinogenesis. The mitogen-induced gene, DUSP2, encodes a nuclear protein, PAC1, that acts as a dual-specific protein phosphatase with stringent substrate specificity for MAP kinase. MAP kinase phosphorylation and consequent enzymatic activation is a central and often obligatory component in signal transduction initiated by growth factor stimulation or resulting from various types of oncogenic transformation. DUSP2 downregulates intracellular signal transduction through the dephosphorylation/inactivation of MAP kinases.

NOV74 is predicted to be expressed in at least the following tissues: retina. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV74 is provided in Example 2.

The NOV74 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, brain disorders including epilepsy, eating disorders, schizophrenia, ADD, and cancer; heart disease; blood disorders, kidney disorders, liver diseases, inflammation and autoimmune disorders including Crohn's disease, IBD, allergies, rheumatoid and osteoarthritis, inflammatory skin disorders, allergies, blood disorders; psoriasis; colon-, ovarian-, testicular-, lymphatic-, brain-, and pancreatic cancers; leukemia AIDS; thalamus disorders; metabolic disorders including diabetes and obesity; lung diseases such as asthma, emphysema, cystic fibrosis, and cancer; pancreatic disorders including pancreatic insufficiency; and prostate disorders including prostate cancer and other diseases, disorders and conditions of the like. The NOV74 nucleic acid encoding the phosphatase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a dual specificity phosphatase-like protein includes the nucleic acid whose sequence is provided in Table 74A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 74A while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a fragment of such a nucleic acid.

The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 74A, including nucleic acid fragments that are complementary to any of the nucleic acids just described. The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 18% of the bases may be so changed.

The novel protein of the invention includes the dual specificity phosphatase-like protein whose sequence is provided in Table 74B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 74B while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 28% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### **NOV75**

The disclosed NOV75 (alternatively referred to herein as CG56783-01) includes the 840 nucleotide sequence (SEQ ID NO:253) shown in Table 75A. A NOV75 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 31-33 and ends with a stop codon at nucleotides 769-771. The disclosed NOV75 maps to human chromosome 1.

A NOV75 polypeptide (SEQ ID NO:254) encoded by SEQ ID NO:253 is 246 amino acids in length and is presented using the one-letter amino acid code in Table 75B. The Psort profile for NOV75 predicts that this sequence has no signal peptide and is likely to be localized at the plasma membrane with a certainty of 0.7000. In alternative embodiments, a NOV75 polypeptide is located, to the endoplasmic reticulum (membrane) with a certainty of 0.1000, or to the nucleus with a certainty of 0.2000.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 167 of 257 bases (64%) identical to a gb:GENBANK-ID:AB027004|acc:AB027004.1 mRNA from *Homo sapiens* (mRNA for protein phosphatase).

The full amino acid sequence of the protein of the invention was found to have 39 of 89 amino acid residues (43%) identical to, and 58 of 89 amino acid residues (65%) similar to, the 198 amino acid residue ptnr:SPTREMBL-ACC:Q9QYJ7 protein from *Mus musculus* (Mouse) (PROTEIN PHOSPHATASE). NOV75 also has homology to the other proteins shown in the

5 BLASTP data in Table 75D.

This BLASTP data is displayed graphically in the ClustalW in Table 75E. A multiple sequence alignment is given, with the NOV75 protein being shown on line 1 in a ClustalW

10 analysis comparing the protein of the invention with the related protein sequences shown in Table 75D.

| Table 75E. Mitogen-activated protein (MAP) kinase phosphatases constitute a growing family of dual specificity phosphatases thought to play a role in the dephosphorylation and inactivation of MAP kinases and are therefore likely to be important in the regulation of diverse cellular processes such as proliferation, differentiation, and apoptosis. For this reason it has been suggested that MAP kinase phosphatases may be tumor suppressors. DUSP6 (alias PYST1), one of the dual-specificity tyrosine phosphatases, is localized on 12q21, one of the regions of frequent allelic loss in pancreatic cancer. This gene is composed of three exons, and two forms of alternatively spliced transcripts are ubiquitously expressed. Although no mutations were observed in 26 pancreatic cancer cell lines, reduced expressions of the full-length transcripts were observed in some cell lines, which may suggest some role for DUSP6 in pancreatic carcinogenesis. The mitogen-induced gene, DUSP2, encodes a nuclear protein, PAC1, that acts as a dual-specific protein phosphatase with stringent substrate specificity for MAP kinase. MAP kinase phosphorylation and consequent enzymatic activation is a central and often obligatory component in signal transduction initiated by growth factor stimulation or resulting

from various types of oncogenic transformation. DUSP2 downregulates intracellular signal transduction through the dephosphorylation/inactivation of MAP kinases.

NOV75 is predicted to be expressed in at least the following tissues: heart, breast and ovarian tissue, pancreas, brain, liver, kidney, spleen, testis, ovary, and peripheral blood leukocytes. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV75 is provided in Example 2.

The NOV75 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, brain disorders including epilepsy, eating disorders, schizophrenia, ADD, and cancer; heart disease; blood disorders, kidney disorders, liver diseases, inflammation and autoimmune disorders including Crohn's disease, IBD, allergies, rheumatoid and osteoarthritis, inflammatory skin disorders, allergies, blood disorders; psoriasis; colon-, ovarian-, testicular-, lymphatic-, brain-, and pancreatic cancers; leukemia AIDS; thalamus disorders; metabolic disorders including diabetes and obesity; lung diseases such as asthma, emphysema, cystic fibrosis, and cancer; pancreatic disorders including pancreatic insufficiency; and prostate disorders including prostate cancer and other diseases, disorders and conditions of the like. The NOV75 nucleic acid encoding the phosphatase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a dual specificity phosphatase-like protein includes the nucleic acid whose sequence is provided in Table 75A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 75A while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a fragment of such a nucleic acid.

The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 75A, including nucleic acid fragments that are complementary to any of the nucleic acids just described. The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such

that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 36% of the bases may be so changed.

The novel protein of the invention includes the dual specificity phosphatase-like protein whose sequence is provided in Table 75B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 75B while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 57% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV76

NOV76 includes two phosphatase-like proteins, designated herein as NOV76a and NOV76b.

#### NOV76a

The disclosed NOV76a (alternatively referred to herein as CG56789-01) includes the 2200 nucleotide sequence (SEQ ID NO:255) shown in Table 76A. A NOV76a ORF begins with a Kozak consensus ATG initiation codon at nucleotides 61-63 and ends with a stop codon at nucleotides 2101-2103. The disclosed NOV76 maps to human chromosome 12.

A NOV76a polypeptide (SEQ ID NO:256) encoded by SEQ ID NO:255 is 680 amino acids in length and is presented using the one-letter amino acid code in Table 76B. The Psort profile for NOV76a predicts that this sequence has no signal peptide and is likely to be localized at the nucleus with a certainty of 0.8800. In alternative embodiments, a NOV76a polypeptide is located to peroxisomal microbodies with a certainty of 0.3000, to the mitochondrial matrix space with a certainty of 0.1000, or to lysosomes with a certainty of 0.1000.

- A NOV76b polypeptide (SEQ ID NO:258) encoded by SEQ ID NO:257 is 662 amino acids in length and is presented using the one-letter amino acid code in Table 76D. The Psort profile for NOV76b predicts that this sequence has no signal peptide and is likely to be
- 5 localized to the nucleus with a certainty of 0.8800. In alternative embodiments, a NOV76b polypeptide is located to peroxisomal microbodies with a certainty of 0.3000.

- A BLAST analysis of NOV76 was run against the proprietary PatP GENESEQ Protein
- 10 Patent database. It was found, for example, that the amino acid sequence of NOV76 had high homology to other proteins as shown in Table 76E.

Table 76E. BLASTX results from PatP database for NOV76

| Sequences producing High-scoring Segment Pairs:            | High Score | Smallest Sum Probability P(N) |
|------------------------------------------------------------|------------|-------------------------------|
|                                                            |            |                               |
| patp:AAE04834 Human SGP002 phosphatase polypeptide         | 3360       | 0.0                           |

| patp:AAW29150 Dual-specific murine thr-tyr phosphatase     | 1088       | 1.5e-125                      |

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 1149 of 1150 bases (99%) identical to a gb:GENBANK-  
 5 ID:AB052156|acc:AB052156.1 mRNA from *Homo sapiens* (MKP-7 mRNA for MAPK phosphatase-7). The full amino acid sequence of the protein of the invention was found to have 662 of 665 amino acid residues (99%) identical to, and 662 of 665 amino acid residues (99%) similar to, the 665 amino acid residue ptnr:SPTREMBL-ACC:Q9BY84 protein from *Homo sapiens* (Human) (MAPK PHOSPHATASE-7). NOV76 also has homology to the  
 10 other proteins shown in the BLASTP data in Table 76F.

Table 76F. NOV76 BLASTP results

This BLASTP data is displayed graphically in the ClustalW in Table 76G. A multiple sequence alignment is given, with the NOV76 protein being shown on line 1 in a ClustalW  
 15 analysis comparing the protein of the invention with the related protein sequences shown in Table 76F.

Mitogen-activated protein kinases (MAPKs) are inactivated via dephosphorylation of either the threonine or tyrosine residue or both in the P-loop catalyzed by protein phosphatases which include serine/threonine phosphatases, tyrosine phosphatases, and dual specificity phosphatases. Nine members of the dual specificity phosphatases specific for MAPKs, termed MKPs, have been reported. Each member has its own substrate specificity, tissue distribution,

and subcellular localization. MKP-7 is most similar to hVH5, a member of previously known MKPs, in the primary structure. MKP-7 is predominantly localized in the cytoplasm when expressed in cultured cells, whereas hVH5 is both in the nucleus and the cytoplasm. MKP-7 binds to and inactivates p38 MAPK and JNK/SAPK, but not ERK. Furthermore, MKPs have the substrate specificity toward the isoforms of the p38 family (alpha, beta, gamma, and delta). MKP-7 binds to and inactivates p38 alpha and -beta, but not gamma or delta. MKP-5 and CL100/MKP-1 also bind to p38 alpha and -beta, but not gamma or delta.

NOV76 is predicted to be expressed in at least the following tissues: blood, brain, CNS, colon, heart, kidney, lung, and stomach. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV76 is provided in Example 2.

The NOV76 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, atrial septal defect (ASD), atrioventricular (A-V) canal defect, ductus arteriosus, pulmonary stenosis, subaortic stenosis, ventricular septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, obesity, transplantation, hypercalcaemia, ulcers, Hirschsprung's disease, Crohn's Disease, anemia, ataxia-telangiectasia, autoimmune disease, immunodeficiencies, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neurodegeneration, neuroprotection, systemic lupus erythematosus, asthma, emphysema, allergy, ARDS, diabetes, renal artery stenosis, interstitial nephritis, glomerulonephritis, polycystic kidney disease, renal tubular acidosis, IgA nephropathy, as well as other diseases, disorders and conditions. NOV76 nucleic acids encoding the MAP kinase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a phosphatase-like protein includes the nucleic acid whose sequence is provided in Table 76A or 76C, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 76A or 76C while still encoding a protein that maintains its phosphatase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary

to the sequence of Table 76A or 76C, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 1% of the bases may be so changed.

The novel protein of the invention includes the phosphatase-like protein whose sequence is provided in Table 76B or 76D. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 76B or 76D while still encoding a protein that maintains its phosphatase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 1% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV77

The disclosed NOV77 (alternatively referred to herein as CG56804-01) includes the 881 nucleotide sequence (SEQ ID NO:259) shown in Table 77A. A NOV77 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 61-63 and ends with a stop codon at nucleotides 769-771. The disclosed NOV77 maps to human chromosome 14.

**Table 77A. NOV77 Nucleotide Sequence (SEQ ID NO:259)**

A NOV77 polypeptide (SEQ ID NO:260) encoded by SEQ ID NO:259 is 236 amino acids in length and is presented using the one-letter amino acid code in Table 77B. The Psort profile for NOV77 predicts that this sequence has no signal peptide and is likely to be

5 localized at the cytoplasm with a certainty of 0.6036. In alternative embodiments, a NOV77 polypeptide is located to lysosomes with a certainty of 0.2040.

A BLAST analysis of NOV77 was run against the proprietary PatP GENESEQ Protein

10 Patent database. It was found, for example, that the amino acid sequence of NOV77 had high homology to other proteins as shown in Table 77C.

**Table 77C. BLASTX results from PatP database for NOV77**

| Sequences producing High-scoring Segment Pairs:               | High Score | Smallest Sum      |

In a search of sequence databases, it was found, for example, that the nucleic acid

15 sequence of this invention has 228 of 249 bases (91%) identical to a gb:GENBANK-ID:MMU34973|acc:U34973.1 mRNA from *Mus musculus* (protein tyrosine phosphatase-like mRNA, unspliced c-terminal product and spliced c-terminal end STYX). The full amino acid sequence of the protein of the invention was found to have 214 of 236 amino acid residues (90%) identical to, and 221 of 236 amino acid residues (93%) similar to, the 223 amino acid

20 residue ptrn:SPTREMBL-ACC:Q60970 protein from *Mus musculus* (Mouse) (PROTEIN TYROSINE PHOSPHATASE-LIKE). NOV77 also has homology to the other proteins shown in the BLASTP data in Table 77D.

Mitogen-activated protein (MAP) kinase phosphatases constitute a growing family of dual specificity phosphatases thought to play a role in the dephosphorylation and inactivation of MAP kinases and are therefore likely to be important in the regulation of diverse cellular

processes such as proliferation, differentiation, and apoptosis. For this reason it has been suggested that MAP kinase phosphatases may be tumor suppressors.

NOV77 is predicted to be expressed in at least the following tissues: lung, lymphoid tissue, spleen, tonsils, whole organism. This information was derived by determining the  
5 tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV77 is provided in Example 2.

The NOV77 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example,  
10 brain disorders including epilepsy, eating disorders, schizophrenia, ADD, and cancer; heart disease; blood disorders, kidney disorders, liver diseases, inflammation and autoimmune disorders including Crohn's disease, IBD, allergies, rheumatoid and osteoarthritis, inflammatory skin disorders, allergies, blood disorders; psoriasis; colon-, ovarian-, testicular-, lymphatic-, brain-, and pancreatic cancers; leukemia AIDS; thalamus disorders; metabolic  
15 disorders including diabetes and obesity; lung diseases such as asthma, emphysema, cystic fibrosis, and cancer; pancreatic disorders including pancreatic insufficiency; and prostate disorders including prostate cancer and other diseases, disorders and conditions of the like. The NOV77 nucleic acid encoding the MAP kinase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of  
20 the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a dual specificity phosphatase-like protein includes the nucleic acid whose sequence is provided in Table 76A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 76A while still encoding a protein  
25 that maintains its dual specificity phosphatase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 76A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or  
30 complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

In the mutant or variant nucleic acids, and their complements, up to about 9% of the bases may be so changed.

The novel protein of the invention includes the dual specificity phosphatase-like protein whose sequence is provided in Table 76B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 76B while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 10% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV78

The disclosed NOV78 (alternatively referred to herein as CG56810-01) includes the 777 nucleotide sequence (SEQ ID NO:261) shown in Table 78A. A NOV78 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 61-63 and ends with a stop codon at nucleotides 768-770. The disclosed NOV78 maps to human chromosome 2.

A NOV78 polypeptide (SEQ ID NO:262) encoded by SEQ ID NO:261 is 224 amino acids in length and is presented using the one-letter amino acid code in Table 78B. The Psort profile for NOV78 predicts that this sequence has no signal peptide and is likely to be localized to the endoplasmic reticulum (membrane) with a certainty of 0.6400. In alternative embodiments, a NOV78 polypeptide is located to the plasma membrane with a certainty of 0.4960, or to the nucleus with a certainty of 0.2420.

A BLAST analysis of NOV78 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV78 had high  
 5 homology to other proteins as shown in Table 78C.

Table 78C. BLASTX results from PatP database for NOV78

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 103 of 160 bases (64%) identical to a gb:GENBANK-  
 10 ID:HS106C24|acc:Z83313.1 mRNA from *Homo sapiens* (Human DNA sequence from PAC 106C24, between markers DXS294 and DXS730 on chromosome X). The full amino acid sequence of the protein of the invention was found to have 71 of 172 amino acid residues (41%) identical to, and 99 of 172 amino acid residues (57%) similar to, the 203 amino acid residue ptnr:SP TREMBL-ACC:Q9NGL1 protein from *Drosophila melanogaster* (Fruit fly)  
 15 (MAP KINASE PHOSPHATASE-1). NOV78 also has homology to the other proteins shown in the BLASTP data in Table 78D.

Table 78F lists the domain description from DOMAIN analysis results against NOV78.

This indicates that the NOV78 sequence has properties similar to those of other proteins known to contain this domain.

5

10 Mitogen-activated protein (MAP) kinase phosphatases constitute a growing family of dual specificity phosphatases thought to play a role in the dephosphorylation and inactivation of MAP kinases and are therefore likely to be important in the regulation of diverse cellular processes such as proliferation, differentiation, and apoptosis. For this reason it has been suggested that MAP kinase phosphatases may be tumor suppressors.

15 NOV78 is predicted to be expressed in at least the following tissues: parathyroid gland, peripheral blood, whole organism. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV78 is provided in Example 2.

The NOV78 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example,

brain disorders including epilepsy, eating disorders, schizophrenia, ADD, and cancer; heart disease; blood disorders, kidney disorders, liver diseases, inflammation and autoimmune disorders including Crohn's disease, IBD, allergies, rheumatoid and osteoarthritis, inflammatory skin disorders, allergies, blood disorders; psoriasis; colon-, ovarian-, testicular-, lymphatic-, brain-, and pancreatic cancers; leukemia AIDS; thalamus disorders; metabolic disorders including diabetes and obesity; lung diseases such as asthma, emphysema, cystic fibrosis, and cancer; pancreatic disorders including pancreatic insufficiency; and prostate disorders including prostate cancer and other diseases, disorders and conditions of the like. NOV78 nucleic acids encoding the MAP kinase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a dual specificity phosphatase-like protein includes the nucleic acid whose sequence is provided in Table 78A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 78A while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 78A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 36% of the bases may be so changed.

The novel protein of the invention includes the dual specificity phosphatase-like protein whose sequence is provided in Table 78B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 78B while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 59% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV79

The disclosed NOV79 (alternatively referred to herein as CG56862-01) includes the 939 nucleotide sequence (SEQ ID NO:263) shown in Table 79A. A NOV79 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 19-21 and ends with a stop codon at nucleotides 928-930. The disclosed NOV79 maps to human chromosome 20.

A NOV79 polypeptide (SEQ ID NO:264) encoded by SEQ ID NO:263 is 303 amino acids in length and is presented using the one-letter amino acid code in Table 79B. The Psort profile for NOV79 predicts that this sequence has a signal peptide and is likely to be localized to the cytoplasm with a certainty of 0.6500. In alternative embodiments, a NOV79 polypeptide is located to lysosomes with a certainty of 0.2216. The Signal P predicts a likely cleavage site for a NOV79 peptide is between positions 24 and 25, *i.e.*, at the dash in the sequence VLG-LQ.

5

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 93 of 118 bases (78%) identical to a gb:GENBANK-ID:HUMFLNG6PD|acc:L44140.1 mRNA from *Homo sapiens* (chromosome X region from filamin (FLN) gene to glucose-6-phosphate dehydrogenase (G6PD). The full amino acid sequence of the protein of the invention was found to have 273 of 276 amino acid residues (98%) identical to, and 274 of 276 amino acid residues (99%) similar to, the 275 amino acid residue ptmr:TREMBLNEW-ACC:CAC10008 protein from *Homo sapiens* (Human) (BA243J16.6 (NOVEL PROTEIN)). NOV79 also has homology to the other proteins shown in the BLASTP data in Table 79D.

15

Mitogen-activated protein (MAP) kinase phosphatases constitute a growing family of dual specificity phosphatases thought to play a role in the dephosphorylation and inactivation of MAP kinases and are therefore likely to be important in the regulation of diverse cellular processes such as proliferation, differentiation, and apoptosis. For this reason it has been suggested that MAP kinase phosphatases may be tumor suppressors.

NOV79 is predicted to be expressed in at least the following tissues: brain, kidney, pancreas, testis, whole organism. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further  
5 expression data for NOV79 is provided in Example 2.

The NOV79 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, brain disorders including epilepsy, eating disorders, schizophrenia, ADD, and cancer; heart disease; blood disorders, kidney disorders, liver diseases, inflammation and autoimmune  
10 disorders including Crohn's disease, IBD, allergies, rheumatoid and osteoarthritis, inflammatory skin disorders, allergies, blood disorders; psoriasis; colon-, ovarian-, testicular-, lymphatic-, brain-, and pancreatic cancers; leukemia AIDS; thalamus disorders; metabolic disorders including diabetes and obesity; lung diseases such as asthma, emphysema, cystic fibrosis, and cancer; pancreatic disorders including pancreatic insufficiency; and prostate  
15 disorders including prostate cancer and other diseases, disorders and conditions of the like. The NOV79 nucleic acid encoding the phosphatase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a dual specificity phosphatase-like  
20 protein includes the nucleic acid whose sequence is provided in Table 79A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 79A while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences  
25 are complementary to the sequence of Table 79A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar  
30 phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 22% of the bases may be so changed.

The novel protein of the invention includes the dual specificity phosphatase-like protein whose sequence is provided in Table 79B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 79B while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 2% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV80

The disclosed NOV80 (alternatively referred to herein as CG56882-01) includes the 2039 nucleotide sequence (SEQ ID NO:265) shown in Table 80A. A NOV80 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 100-102 and ends with a TGA codon at nucleotides 1947-1949. The disclosed NOV80 maps to human chromosome 10.

A NOV80 polypeptide (SEQ ID NO:266) encoded by SEQ ID NO:265 is 616 amino acids in length and is presented using the one-letter amino acid code in Table 80B. The Psort profile for NOV80 predicts that this sequence is a Type Ib membrane protein, has no signal peptide, and is likely to be localized at the plasma membrane with a certainty of 0.7000. In  
 5 alternative embodiments, a NOV80 polypeptide is located to peroxisomal microbodies with a certainty of 0.3000, to the mitochondrial inner membrane with a certainty of 0.2143, or to the nucleus with a certainty of 0.3000.

15 In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 1587 of 1930 bases (82%) identical to a gb:GENBANK-ID:HSU27193|acc:U27193.1 mRNA from *Homo sapiens* (Human protein-tyrosine phosphatase mRNA). The full amino acid sequence of the protein of the invention was found to have 489 of 625 amino acid residues (78%) identical to, and 514 of 625 amino acid residues  
 20 (82%) similar to, the 625 amino acid residue ptnr:SWISSNEW-ACC:Q13202 protein from

*Homo sapiens* (Human) (DUAL SPECIFICITY PROTEIN PHOSPHATASE 8 (EC 3.1.3.48) (EC 3.1.3.16) (DUAL SPECIFICITY PROTEIN PHOSPHATASE HVH-5)). (NOV80 also has homology to the other proteins shown in the BLASTP data in Table 80D.

Table 80F lists the domain description from DOMAIN analysis results against NOV80. This indicates that the NOV80 sequence has properties similar to those of other proteins known to contain this domain.

5

Mitogen-activated protein (MAP) kinase phosphatases constitute a growing family of dual specificity phosphatases thought to play a role in the dephosphorylation and inactivation of MAP kinases and are therefore likely to be important in the regulation of diverse cellular processes such as proliferation, differentiation, and apoptosis. For this reason it has been suggested that MAP kinase phosphatases may be tumor suppressors.

NOV80 is predicted to be expressed in at least the following tissues: kidney. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV80 is provided in Example 2.

The NOV80 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, brain disorders including epilepsy, eating disorders, schizophrenia, ADD, and cancer; heart disease; blood disorders, kidney disorders, liver diseases, inflammation and autoimmune disorders including Crohn's disease, IBD, allergies, rheumatoid and osteoarthritis, inflammatory skin disorders, allergies, blood disorders; psoriasis; colon-, ovarian-, testicular-, lymphatic-, brain-, and pancreatic cancers; leukemia AIDS; thalamus disorders; metabolic disorders including diabetes and obesity; lung diseases such as asthma, emphysema, cystic

fibrosis, and cancer; pancreatic disorders including pancreatic insufficiency; and prostate disorders including prostate cancer and other diseases, disorders and conditions of the like. The NOV80 nucleic acid encoding the phosphatase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of  
5 the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a dual specificity phosphatase-like protein includes the nucleic acid whose sequence is provided in Table 80A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 80A while still encoding a protein  
10 that maintains its dual specificity phosphatase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 80A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or  
15 complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.  
20 In the mutant or variant nucleic acids, and their complements, up to about 18% of the bases may be so changed.

The novel protein of the invention includes the dual specificity phosphatase-like protein whose sequence is provided in Table 80B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown  
25 in Table 80B while still encoding a protein that maintains its dual specificity phosphatase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 22% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind  
30 immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV81

NOV81 includes two galactosyltransferase-like proteins, designated herein as NOV81a and NOV81b.

### NOV81a

- 5 The disclosed NOV81a (alternatively referred to herein as CG56283-01) includes the 1247 nucleotide sequence (SEQ ID NO:267) shown in Table 81A. A NOV81a ORF begins with a Kozak consensus ATG initiation codon at nucleotides 33-35 and ends with a stop codon at nucleotides 1224-1226. The disclosed NOV81a maps to human chromosome 19.

A NOV81a polypeptide (SEQ ID NO:268) encoded by SEQ ID NO:267 is 397 amino acids in length and is presented using the one-letter amino acid code in Table 81B. The Psort profile for NOV81a predicts that this sequence has a signal peptide and is likely to be localized to lysosomes with a certainty of 0.8650, or to the outside of the cell with a certainty of 0.8191. The Signal P predicts a likely cleavage site for a NOV81a peptide is between positions 34 and 35, *i.e.*, at the dash in the sequence SKA-YP.

### NOV81b

The disclosed NOV81b (alternatively referred to herein as CG56283-02) includes the 1368 nucleotide sequence (SEQ ID NO:269) shown in Table 81C. A SEC2 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 4-6 and ends with a TGA codon at nucleotides 1195-1197. In Table 81C, putative untranslated regions are indicated by underlining, and the stop and start codons are indicated in bold. The disclosed NOV81b maps to human chromosomes 19.

A BLAST analysis of NOV81 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV81 had high  
5 homology to other proteins as shown in Table 81E.

**Table 81E. BLASTX results from PatP database for NOV81**

| Sequences producing High-scoring Segment Pairs:           | High<br>Score | Smallest<br>Sum     |

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 647 of 1088 bases (59%) identical to a gb:GENBANK-  
10 ID:AP001754|acc:AP001754.1 mRNA from *Homo sapiens* (genomic DNA, chromosome 21q, section 98/105). The full amino acid sequence of the protein of the invention was found to have 127 of 343 amino acid residues (37%) identical to, and 194 of 343 amino acid residues (56%) similar to, the 397 amino acid residue ptrn:TREMBLNEW-ACC:AAD09763 protein from *Mus musculus* (Mouse) (BETA-1,3-N-ACETYLGLUCOSAMINYLTRANSFERASE  
15 (EC 2.4.1.149)). NOV81 also has homology to the other proteins shown in the BLASTP data in Table 81F.

**Table 81F. NOV81 BLASTP results**

Table 81H lists the domain description from DOMAIN analysis results against NOV81. This indicates that the NOV81 sequence has properties similar to those of other proteins known to contain this domain.

| Table 81H. Domain Analysis of NOV81                                                                                                                                                                                                                                                                                                                                                                     |     |                                                              |     |  |

| gnl Pfam pfam01762, Galactosyl_T, Galactosyltransferase. This family includes the galactosyltransferases UDP-galactose:2-acetamido-2-deoxy-D-glucose3beta-galactosyltransferase and UDP-Gal:beta-GlcNAc beta 1,3-galactosyltransferase. Specific galactosyltransferases transfer galactose to GlcNAc terminal chains in the synthesis of the lacto-series oligosaccharides types 1 and 2. SEQ ID NO:874 |     |                                                              |     |  |

5

There are 2 known types of carbohydrate chains in the lacto series of oligosaccharides: type 1 chains, which contain the Gal(beta-1-3)GlcNAc linkage, and type 2 chains, which contain the topoisomer Gal(beta-1-4)GlcNAc. The biosynthesis of both types of chains is catalyzed by specific galactosyltransferases (GalTs), which transfer galactose (Gal) to N-acetylglucosamine (GlcNAc)-terminating chains. Beta-4-GalT enzymes (e.g., GGTB2; are the galactosyltransferases responsible for type 2 chain biosynthesis, while beta-3-GalTs are the type 1 elongating enzymes.

Kolbinger et al. (1998) searched an expressed sequence tag (EST) database with the amino acid sequence of a human beta-3-GalT, which they called beta-3-GalT1, and identified human brain cDNAs encoding a novel beta-3-GalT, which they named beta-3-GalT2. The deduced 422-amino acid beta-3-GalT2 protein has a predicted type II transmembrane topology with 5 potential N-glycosylation sites, and a predicted molecular mass of 49,202 Da. Beta-3-GalT2 shares 46% amino acid identity with beta-3-GalT1, but has a 17-amino acid extension at the carboxy terminus and longer cytoplasmic and stem regions. Beta-3-GalT2 directed the

synthesis of type 1 chains in mammalian cells and transferred Gal to GlcNAc- and Gal-terminating acceptors in enzymatic assays.

Northern blot analysis demonstrated strong expression of a 3.5-kb beta-3-GalT2 transcript, and weaker expression of a 2.8-kb transcript, in heart and brain. Amado et al. (1998) stated that a human beta-3-galactosyltransferase gene, called beta-3-GalT1 by them, was isolated from a melanoma cell line using a transfection-cloning strategy. Beta-3-GalT1 is a predicted 326-amino acid protein. By carrying out a BLAST search of an EST database with the beta-3-GalT1 coding sequence, Amado et al. (1998) identified cDNAs encoding 3 other beta-3-galactosyltransferases, beta-3-GalT2, beta-3-GalT3, and beta-3-GalT4. The sequences of the 4 predicted proteins share 29 to 42% identity and have several conserved short sequence motifs. All 4 appear to be evolutionarily related, since their coding regions are contained in a single exon.

Using an insect cell expression system, Amado et al. (1998) showed that beta-3-GalT1 and beta-3-GalT2 are UDP-galactose:beta-N-acetyl-glucosamine beta-1,3 galactosyltransferases with similar kinetic properties. Northern blot analysis revealed that beta-3-GalT1 is expressed as a 6.5-kb mRNA exclusively in brain. Hennet et al. (1998) identified a mouse beta-3-GalT1 homolog, designated beta-3-GalTI, and found that the coding region was contained in a single exon.

NOV81 is predicted to be expressed in at least the following tissues: colon, blood, and lymphocyte. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV81 is provided in Example 2.

The NOV81 nucleic acids and proteins of are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, autoimmune disease, allergies, immunodeficiencies, transplantation, graft versus host disease (GVHD), lymphoedema, anemia, ataxia-telangiectasia, autoimmune disease, immunodeficiencies, Hirschsprung's disease, Crohn's Disease, appendicitis as well as other diseases, disorders and conditions. NOV81 nucleic acids encoding the galactosyltransferase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a beta-1,3-galactosyltransferase-like protein includes the nucleic acid whose sequence is provided in Table 81A or 81C, or a

fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 81A or 81C while still encoding a protein that maintains its beta-1,3-galactosyltransferase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes  
5 nucleic acids whose sequences are complementary to the sequence of Table 81A or 81C, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications  
10 include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 41% of the bases  
15 may be so changed.

The novel protein of the invention includes the beta-1,3-galactosyltransferase-like protein whose sequence is provided in Table 81B or 81D. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 81B or 81D while still encoding a protein that maintains its beta-1,3-  
20 galactosyltransferase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 63% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic  
25 methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV82

30 The disclosed NOV82 (alternatively referred to herein as CG56983-01) includes the 348 nucleotide sequence (SEQ ID NO:271) shown in Table 82A. A NOV82 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 9-11 and ends with a stop codon at nucleotides 321-322. The disclosed NOV82 maps to human chromosome X.

**Table 82A. NOV82 Nucleotide Sequence (SEQ ID NO:271)**

A NOV82 polypeptide (SEQ ID NO:272) encoded by SEQ ID NO:271 is 104 amino acids in length and is presented using the one-letter amino acid code in Table 82B. The Psort profile for NOV82 predicts that this sequence has a signal peptide and is likely to be localized at the exterior of the cell with a certainty of 0.8200. In alternative embodiments, a NOV82 polypeptide is located to the endoplasmic reticulum (membrane) with a certainty of 0.1000. The Signal P predicts a likely cleavage site for a NOV82 peptide is between positions 28 and 29, i.e., at the dash in the sequence VDT-CP.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 217 of 288 bases (75%) identical to a gb:GENBANK-ID:HUMPYYP3|acc:D13902.1 mRNA from *Homo sapiens* (Human mRNA for peptide YY). The full amino acid sequence of the protein of the invention was found to have 62 of 94 amino acid residues (65%) identical to, and 73 of 94 amino acid residues (77%) similar to, the 97 amino acid residue ptrn:SWISSNEW-ACC:P10082 protein from *Homo sapiens* (Human)

(PEPTIDE YY PRECURSOR (PYY)). NOV82 also has homology to the other proteins shown in the BLASTP data in Table 82D.

Pancreatic hormone (PP) is a peptide synthesized in pancreatic islets of Langerhans, which acts as a regulator of pancreatic and gastrointestinal functions. The hormone is produced as a larger propeptide, which is enzymatically cleaved to yield the mature active peptide, which is 36 amino acids in length and has an amidated C-terminus. The hormone has a globular structure with residues 2-8 forming a left-handed poly-proline-II-like helix, residues 9-13 a beta turn, and 14-32 an alpha-helix, held close to the first helix by hydrophobic interactions. Unlike glucagon, another peptide hormone, the structure of pancreatic peptide is preserved in aqueous solution. Both N- and C-termini are required for activity: receptor binding and activation functions may reside in the N- and C-termini respectively.

PYY is secreted from endocrine cells in the lower small intestine, colon, and pancreas. It acts on the gastrointestinal tract as an inhibitor of gastric acid secretion, gastric emptying, digestive enzyme secretion by the pancreas, and gut motility (Leiter et al., 1987). A related peptide, pancreatic polypeptide is secreted only by cells within the endocrine and exocrine pancreas and specifically inhibits the secretion of enzymes and bicarbonate from the exocrine pancreas. A third member of this gene family is neuropeptide Y.

Each of these proteins are synthesized with a signal peptide sequence followed by a 36-amino acid active peptide and a carboxyterminal peptide. During maturation, the signal and carboxyterminal peptides are cleaved and a common carboxyterminal tyrosine in the mature peptide is amidated. Hort et al. (1995) cloned the human PYY gene by screening a genomic library with a PCR product produced from the rat locus. The gene contains 4 exons spanning

about 1.2-kb of DNA. Exon 1 represents 5-prime untranslated sequence and is 75% identical to the comparable rat sequence.

PYY and PPY are about 10-kb apart and are mapped them by fluorescence in situ hybridization to 17q21. Based on a comparison of the 3 gene sequences, it has been concluded  
5 that NPY and PYY are the result of a gene duplication event, and that a subsequent tandem duplication produced the PPY gene. Pancreatic polypeptide, peptide tyrosine-tyrosine (PYY), and neuropeptide tyrosine (NPY), three members of a family of structurally related peptides, are mainly expressed in the endocrine pancreas, in endocrine cells of the gut, and in the brain, respectively. Synthetic human PYY prepared using a solid-phase synthetic technique was  
10 found to be structurally identical to the natural peptide.

NOV82 is predicted to be expressed in at least the following tissues: endothelium, esophageal carcinoma. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for  
15 NOV82 is provided in Example 2.

The novel nucleic acids of the invention encoding a PEPTIDE YY -like proteins includes the nucleic acid whose sequence is provided in Table 82A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 82A while still encoding a protein that maintains  
20 its PEPTIDE YY -like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 82A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or  
25 complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.  
30 In the mutant or variant nucleic acids, and their complements, up to about 25% of the bases may be so changed.

The novel protein of the invention includes the PEPTIDE YY -like protein whose sequence is provided in Table 82B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 82B while

still encoding a protein that maintains its PEPTIDE YY -like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 35% of the amino acid residues may be so changed.

The NOV82 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, esophageal carcinoma, inflammatory bowel disease, diverticular disease, as well as other diseases, disorders and conditions. NOV82 nucleic acids encoding the peptide YY-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV83

The disclosed NOV83 (alternatively referred to herein as CG56890-01) includes the 1701 nucleotide sequence (SEQ ID NO:273) shown in Table 83A. A NOV83 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 19-21 and ends with a stop codon at nucleotides 1669-1671. The disclosed NOV83 maps to human chromosome 17.

A NOV83 polypeptide (SEQ ID NO:274) encoded by SEQ ID NO:273 is 550 amino acids in length and is presented using the one-letter amino acid code in Table 83B. The Psort profile for NOV83 predicts that this sequence is likely to be localized to the nucleus with a certainty of 0.9685. In alternative embodiments, a NOV83 polypeptide is located to microbodies with a certainty of 0.1317.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 1359 of 1700 bases (79%) identical to a gb:GENBANK-ID:AF063016|acc:AF063016.1 mRNA from *Spermophilus tridecemlineatus* (*Spermophilus tridecemlineatus* G protein-coupled receptor kinase GRK7 mRNA). The full amino acid sequence of the protein of the invention was found to have 463 of 549 amino acid residues (84%) identical to, and 502 of 549 amino acid residues (91%) similar to, the 548 amino acid residue ptnr:SPTREMBL-ACC:Q9Z2G7 protein from *Spermophilus tridecemlineatus*

(Thirteen-lined ground squirrel) (G PROTEIN-COUPLED RECEPTOR KINASE GRK7).  
NOV83 also has homology to the other proteins shown in the BLASTP data in Table 83D.

Table 83F lists the domain description from DOMAIN analysis results against NOV83. This indicates that the NOV83 sequence has properties similar to those of other proteins known to contain this domain.

| Table 83F. Domain Analysis of NOV83                                                                   |     |                                                               |     |  |  |

5

Serine/threonine protein kinases are an extensive family of enzymes that catalyzes the phosphorylation of serine or threonine residues on its target protein. Protein kinases share a conserved catalytic core common to both serine/ threonine and tyrosine protein kinases. This domain contains residues, which are specific to the distinct types of protein kinases

- 10 The S6/H4 kinase purified from human placenta catalyzes phosphorylation of the S6 ribosomal protein, histone H4, and myelin basic protein. In vitro activation of the p60 S6/H4 kinase requires removal of an autoinhibitory domain by mild trypsin digestion and autophosphorylation of the catalytic domain (p40 S6/H4 kinase). The two autophosphorylation/autoactivation sites contain the sequences SSMVGTPY (site 1) and
- 15 SVIDPVPAPVGDSHVDGAAK (site 2) (SEQ ID NO:1381). These sequences identify S6H4 kinase as the rac-activated PAK65 (Martin, G. A., Bollag, G., McCormick, F. and Abo, A. (1995) EMBO J. 14, 1971-1978). Site 1 phosphorylation is most rapid, but activation does not occur until site 2 is autophosphorylated. The site 1 phosphorylation occurs by an intramolecular mechanism whereas site 2 autophosphorylation occurs by an intermolecular
- 20 mechanism. A model is proposed in which phosphorylation of sites 1 and 2 occurs sequentially. The model proposes that trypsin treatment of the inactive holoenzyme removes

an inhibitory rac-binding domain which blocks MgATP access to the catalytic site. The pseudosubstrate domain at site 1 is autophosphorylated and subsequent bimolecular autophosphorylation at site 2 fully opens the catalytic site. Phosphorylation by a regulatory protein kinase may occur at site 2 in vivo.

5        Rapid regulation of G-protein-coupled receptors (GPCRs) involves agonist- promoted receptor phosphorylation by GPCR kinases (GRKs) . This process is followed by arrestin binding and transient receptor internalisation. It has been shown that beta-adrenergic receptor kinase (beta ARK-1 or GRK2) follows a similar pattern of internalisation upon agonist activation of beta(2)-adrenergic receptors (beta(2)AR) and that beta ARK expression levels  
10        modulate receptor sequestration.

      Such studies indicate a functional relationship between receptor phosphorylation and sequestration, showing that beta ARK not only translocates from the cytoplasm to the plasma membrane in response to receptor occupancy, but also shares endocytic mechanisms with the beta(2)AR . These results suggest a role for beta ARK in the sequestration process, or  
15        involvement of receptor internalisation in the intracellular trafficking of the kinase.

      NOV83 is predicted to be expressed in at least the following tissues: retina, spleen. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV83 is provided in  
20        Example 2.

      The NOV83 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, graft vesus host disease, Von Hippel-Lindau (VHL) syndrome, diabetes, tuberous sclerosis, as well as other  
25        diseases, disorders and conditions. NOV83 nucleic acids encoding the GPCR-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

      The novel nucleic acid of the invention encoding a G protein-coupled receptor kinase GRK7-like protein includes the nucleic acid whose sequence is provided in Table 83A, or a  
30        fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 83A while still encoding a protein that maintains its G protein-coupled receptor kinase GRK7-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes

nucleic acids whose sequences are complementary to the sequence of Table 83A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 21% of the bases may be so changed.

The novel protein of the invention includes the G protein-coupled receptor kinase GRK7-like protein whose sequence is provided in Table 83B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 83B while still encoding a protein that maintains its G Protein-Coupled Receptor Kinase GRK7-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 16% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV84

The disclosed NOV84 (alternatively referred to herein as CG56912-01) includes the 2355 nucleotide sequence (SEQ ID NO:275) shown in Table 84A. A NOV84 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 11-13 and ends with a stop codon at nucleotides 2336-2338. The disclosed NOV84 maps to human chromosome 17.

A NOV84 polypeptide (SEQ ID NO:276) encoded by SEQ ID NO:275 is 775 amino acids in length and is presented using the one-letter amino acid code in Table 84B. The Psort profile for NOV84 predicts that this sequence is likely to be localized to the cytoplasm with a certainty of 0.4500. In alternative embodiments, a NOV84 polypeptide is located to microbodies with a certainty of 0.3000.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 954 of 1415 bases (67%) identical to a gb:GENBANK-ID:OCPLCMR|acc:Z49747.1 mRNA from *Oryctolagus cuniculus* (*O.cuniculus* mRNA for phospholipase C). The full amino acid sequence of the protein of the invention was found to have 381 of 745 amino acid residues (51%) identical to, and 524 of 745 amino acid residues (70%) similar to, the 745 amino acid residue ptnr:SPTREMBL-ACC:Q60450 protein from *Cricetulus griseus* (Chinese hamster) (PHOSPHOLIPASE C-DELTA1). NOV84 also has homology to the other proteins shown in the BLASTP data in Table 84D.

Table 84F lists the domain description from DOMAIN analysis results against NOV84. This indicates that the NOV84 sequence has properties similar to those of other proteins known to contain this domain.

5

| <u>gnl Smart smart00148</u> , PLCXc, Phospholipase C, catalytic domain (part); domain X; Phosphoinositide-specific phospholipases C. These enzymes contain 2 regions (X and Y) which together form a TIM barrel-like structure containing the active site residues. Phospholipase C enzymes (PI-PLC) act as signal transducers that generate two second messengers, inositol-1,4,5-trisphosphate and diacylglycerol. The bacterial enzyme appears to be a homologue of the mammalian PLCs. SEQ ID NO: 877 |                                                              |     |  |  |
| CD-Length = 145 residues, 93.1% aligned                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                              |     |  |  |

Phosphoinositide-specific phospholipase C acts as a signal transducer that generates two messengers, diacylglycerol and inositol 1,4,5-trisphosphate, by hydrolyzing inositol phospholipids. Molecules belonging to the PLC family are divided into subfamilies, PLC-beta, PLC-gamma, and PLC-delta, whose amino acid sequences are highly conserved in two distinct regions designated X and Y. PLC-delta-1 is distinguished from PLC-gamma by lack of the SH2 and SH3 domains that are essential for activation of PLC-gamma by tyrosine protein kinases, and from PLC-beta by lack of the C-terminal region of PLC-beta that is responsible for binding and activation by G proteins.

Cheng et al. (1995) cloned cDNA for human PLC-delta-1 and localized the gene to chromosome 3 by means of a human/rodent somatic cell panel (Lyu et al., 1996). In the course of a large-scale sequencing analysis of genomic DNA in the vicinity of the homozygous deletion on chromosome 3p found in a lung cancer cell line, Ishikawa et al. (1997) found that the gene encoding phospholipase C, delta-1 (PLCD1) is located just distal to the region removed by the deletion. They found that the gene consists of 15 exons and spans about 22 kb. By fluorescence in situ hybridization, they localized the PLCD1 gene to 3p22-p21.3. Shimohama et al. (1998) examined the entire sequences corresponding to protein-coding exons 2-15 of the hamster PLC-delta-1 gene in genomic DNA derived from the leukocytes of 13 unrelated patients with early-onset sporadic Alzheimer disease. In 1 of these patients whose clinical features and course did not differ from those of the other 12 cases, they found a change of codon CGC (arg) to CAC (his), located in the pleckstrin homology domain of the PLCD1 gene. They stated that this was the first mutation found in the human PLC genes.

Site-directed mutagenesis of the glutathione-S-transferase (GST/PLCD1) fusion protein changing arg105 to his resulted in a 4-fold decrease in the affinity of specific binding and a reduction in hydrolyzing activity to about 40% of that of the wildtype enzyme. This remarkable loss of function could be interpreted in terms of a conformational change in the pleckstrin homology domain. Shimohama et al. (1998) found that the arg105-to-his mutation was present in heterozygous state in the patient with AD. The mutation was not found in DNA extracted from leukocytes of 23 unrelated patients with familial AD, 23 unrelated patients with early-onset sporadic AD, 46 unrelated patients with late-onset sporadic AD, and 456 nondemented control subjects. Thus the change did not appear to be a common polymorphism.

However, determination of the possible pathologic role required transgenic studies of the mutant gene to determine the role of the enzyme and the mutation and a search for other mutations in the pleckstrin homology domain of PLC genes in human subjects with genetic disorders. In vitro single point mutagenesis, inositol phospholipid hydrolysis, and substrate protection experiments were used to identify catalytic residues of human phosphatidylinositide-specific phospholipase C delta 1 (PLC delta 1) isolated from a human aorta cDNA library. Invariant amino acid residues containing a functional side chain in the highly conserved X region were changed by in vitro mutagenesis. Most of the mutant enzymes were still able to hydrolyze inositol phospholipid with activity ranging from 10 to 100% of levels in the wild type enzyme. Exceptions were mutants with the conversion of Arg338 to Leu (R338L), Glu341 to Gly (E341G), or His356 to Leu (H356L), which made the enzyme severely defective in hydrolyzing inositol phospholipid. Phospholipid vesicle binding

experiments showed that these three cleavage-defective mutant forms of PLC delta 1 could specifically bind to phosphatidylinositol 4,5-bisphosphate (PIP2) with an affinity similar to that of wild type enzyme. Western blotting analysis of trypsin-treated enzyme-PIP2 complexes revealed that a 67-kDa major protein fragment survived trypsin digestion if the wild type  
5 enzyme, E341G, or H356L mutant PLC delta 1 was preincubated with 7.5 microM PIP2, whereas if it was preincubated with 80 microM PIP2, the size of major protein surviving was comparable to that of intact enzyme. However, mutant enzyme R338L was not protected from trypsin degradation by PIP2 binding. These observations suggest that PLC delta 1 can recognize PIP2 through a high affinity and a low affinity binding site and that residues Glu341  
10 and His356 are not involved in either high affinity or low affinity PIP2 binding but rather are essential for the Ca(2+)-dependent cleavage activity of PLC.

NOV84 is predicted to be expressed in at least the following tissues: aorta, brain, colon, foreskin, heart, muscle, placenta, stomach, uterus, whole embryo, brain, colon, eye, head and neck, lung, muscle, ovary, pancreas, placenta, skin, stomach, uterus. This  
15 information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV84 is provided in Example 2.

The NOV84 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example,  
20 cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, atrial septal defect (ASD), atrioventricular (A-V) canal defect, ductus arteriosus, pulmonary stenosis, subaortic stenosis, ventricular septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, obesity, transplantation as well as other diseases, disorders and conditions. NOV84 nucleic acids encoding the phospholipase-like protein of the invention, or fragments  
25 thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a Phospholipase C delta 1 -like protein includes the nucleic acid whose sequence is provided in Table 84A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may  
30 be changed from the corresponding base shown in Table 84A while still encoding a protein that maintains its Phospholipase C delta 1 -like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 84A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least  
 5 in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 33% of the bases may be so changed.

The novel protein of the invention includes the Phospholipase C delta 1-like protein  
 10 whose sequence is provided in Table 84B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 84 while still encoding a protein that maintains its Phospholipase C delta 1-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 49% of the amino acid residues may be so changed.

15 These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

20

### NOV85

The disclosed NOV85 (alternatively referred to herein as CG56955-01) includes the  
 4091 nucleotide sequence (SEQ ID NO:277) shown in Table 85A. A NOV85 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 13-15 and ends with a stop codon  
 25 at nucleotides 4078-4080.

**Table 85A. NOV85 Nucleotide Sequence (SEQ ID NO:277)**

5 A NOV85 polypeptide (SEQ ID NO:278) encoded by SEQ ID NO:277 is 1355 amino acids in length and is presented using the one-letter amino acid code in Table 85B. The Psort profile for NOV85 predicts that this sequence is likely to be localized to the nucleus with a certainty of 0.7000. In alternative embodiments, a NOV85 polypeptide is located to the mitochondrial matrix space with a certainty of 0.3600, or to microbodies with a certainty of 0.3000.

```

A BLAST analysis of NOV85 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV85 had high homology to other proteins as shown in Table 85C.

5

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 3871 of 3875 bases (99%) identical to a gb:GENBANK-ID:AB037845|acc:AB037845.1 mRNA from *Homo sapiens* (mRNA for KIAA1424 protein).

10 The full amino acid sequence of the protein of the invention was found to have 1285 of 1287 amino acid residues (99%) identical to, and 1286 of 1287 amino acid residues (99%) similar to, the 1286 amino acid residue ptnr:SPTREMBL-ACC:Q9P2C3 protein from *Homo sapiens* (Human) (KIAA1424 PROTEIN). NOV85 also has homology to the other proteins shown in the BLASTP data in Table 85D.

This BLASTP data is displayed graphically in the ClustalW in Table 85E. A multiple sequence alignment is given, with the NOV85 protein being shown on line 1 in a ClustalW analysis comparing the protein of the invention with the related protein sequences shown in

5 Table 85D.

| Table 85E. ClustalW Alignment of NOV85                                                                                                                                                                   |                 |

Rho GTPases control a variety of cellular processes. There are three subtypes of Rho GTPases in the Ras superfamily of small G proteins: RHO, RAC, and CDC42. GTPase-activating proteins (GAPs) bind activated forms of Rho GTPases and stimulate GTP hydrolysis. Through this catalytic function, Rho GAPs negatively regulate Rho-mediated signals. GAPs may also serve as effector molecules and play a role in signaling downstream of Rho and other Ras-like GTPases.

By screening a Jurkat cDNA library using a yeast 2-hybrid system with an activated form of RAC as bait, followed by screening a placenta cDNA library, Toure et al. (1998) isolated a cDNA encoding RACGAP1, which they called MGCRCAGAP. The predicted 527-amino acid RACGAP1 protein has a large N-terminal region containing a protein kinase C-like cysteine-rich motif. RACGAP1 shares highest homology with the *Drosophila* RnRacGAP and the chimerins of rat and human. Functional analysis showed that the GAP domain of RACGAP1 exhibits strong GAP activity towards CDC42, RAC1, and RAC2. Northern blot analysis detected an approximately 3.2-kb RACGAP1 transcript that was most abundantly expressed in testis, with low expression in most other tissues. Western blot analysis detected a RACGAP1 protein of 58 kD in testis extracts. In situ hybridization showed that RACGAP1 expression is restricted to germ cells in mature testis. Human breakpoint cluster region (bcr) gene product is a member of a group of GTPase-activating proteins that act exclusively on members of the Ras-related Rho subfamily. A complementary DNA was isolated from *Caenorhabditis elegans* that encoded a polypeptide of 1438 amino acid residues, CeGAP, which contains a domain with sequence similarity to the COOH-terminal segment (GTPase-activating protein region) of Bcr and other known GTPase-activating proteins of the Rho subfamily. It also contains a "pleckstrin homology" motif, present in many signaling proteins

including GTPase-activating proteins and nucleotide exchange factors. The Bcr-like domain of CeGAP exhibited activity not only on members of the *C. elegans* and human Rho subfamily but surprisingly also on *C. elegans* Ras protein (let-60), human Ras, and Rab3A.

CeGAP is therefore the first GTPase-activating protein acting on Ras-related proteins  
5 across different subfamilies. Together with the presence of the pleckstrin homology motif, this suggests a central and integrative role for CeGAP in a signaling pathway common to Ras and related proteins.

NOV85 is predicted to be expressed in at least the following tissues: pancreas, stomach, brain, bone. This information was derived by determining the tissue sources of the  
10 sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV85 is provided in Example 2.

The NOV85 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Alzheimer's  
15 disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hypercalcaemia, ulcers, diabetes, Von Hippel-Lindau (VHL) syndrome, pancreatitis, obesity as well as other diseases, disorders and conditions. NOV85 nucleic acids encoding the CeGAP-  
20 like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a GTPase activating protein-like protein includes the nucleic acid whose sequence is provided in Table 85A, or a fragment  
25 thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 85A while still encoding a protein that maintains its GTPase activating protein-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 85A, including nucleic acid fragments that are  
30 complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least

in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 1% of the bases may be so changed.

5 The novel protein of the invention includes the GTPase activating protein-like protein whose sequence is provided in Table 85B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 85B while still encoding a protein that maintains its GTPase activating protein-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein,  
10 up to about 1% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section  
15 below.

### NOV86

The disclosed NOV86 (alternatively referred to herein as CG56957-01) includes the 3451 nucleotide sequence (SEQ ID NO:279) shown in Table 86A. A NOV86 ORF begins  
20 with a Kozak consensus ATG initiation codon at nucleotides 35-37 and ends with a stop codon at nucleotides 3442-3445.

**Table 86A. NOV86 Nucleotide Sequence (SEQ ID NO:279)**

A NOV86 polypeptide (SEQ ID NO:280) encoded by SEQ ID NO:279 is 1136 amino acids in length and is presented using the one-letter amino acid code in Table 86B. The Psort profile for NOV86 predicts that this sequence is likely to be localized to the nucleus with a certainty of 0.9800.

**Table 86B. NOV86 Polypeptide Sequence (SEQ ID NO:280)**

A BLAST analysis of NOV86 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV86 had high homology to other proteins as shown in Table 86C.

Table 86C. BLASTX results from PatP database for NOV86

| Sequences producing High-scoring Segment Pairs:         | High Score | Smallest Sum     |
|---------------------------------------------------------|------------|------------------|
|                                                         |            | Probability P(N) |
| patp:AAU17313 Novel signal transduction pathway protein | 2855       | 5.7e-299         |

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 3447 of 3451 bases (99%) identical to a gb:GENBANK-

- 5 ID:D86976|acc:D86976.1 mRNA from *Homo sapiens* (Human mRNA for KIAA0223 gene). The full amino acid sequence of the protein of the invention was found to have 1134 of 1136 amino acid residues (99%) identical to, and 1135 of 1136 amino acid residues (99%) similar to, the 1165 amino acid residue ptrn:SPTREMBL-ACC:Q92619 protein from *Homo sapiens* (Human) (MYELOBLAST KIAA0223). NOV86 also has homology to the other proteins
- 10 shown in the BLASTP data in Table 86D.

Table 86D. NOV86 BLASTP results

This BLASTP data is displayed graphically in the ClustalW in Table 86E. A multiple sequence alignment is given, with the NOV86 protein being shown on line 1 in a ClustalW

15 analysis comparing the protein of the invention with the related protein sequences shown in Table 86D.

Rho GTPases control a variety of cellular processes. There are 3 subtypes of Rho GTPases in the Ras superfamily of small G proteins: RHO, RAC, and CDC42. GTPase-activating proteins (GAPs) bind activated forms of Rho GTPases and stimulate GTP hydrolysis. Through this catalytic function, Rho GAPs negatively regulate Rho-mediated signals. GAPs may also serve as effector molecules and play a role in signaling downstream of Rho and other Ras-like GTPases.

By screening a Jurkat cDNA library using a yeast 2-hybrid system with an activated form of RAC as bait, followed by screening a placenta cDNA library, Toure et al. (1998) isolated a cDNA encoding RACGAP1, which they called MGCRCACGAP. The predicted 527-amino acid RACGAP1 protein has a large N-terminal region containing a protein kinase C-like cysteine-rich motif. RACGAP1 shares highest homology with the Drosophila RnRacGAP and the chimerins of rat and human. Functional analysis showed that the GAP domain of RACGAP1 exhibits strong GAP activity towards CDC42, RAC1, and RAC2. Northern blot analysis detected an approximately 3.2-kb RACGAP1 transcript that was most abundantly expressed in testis, with low expression in most other tissues. Western blot analysis detected a RACGAP1 protein of 58 kD in testis extracts. In situ hybridization showed that RACGAP1 expression is restricted to germ cells in mature testis Human breakpoint cluster region (bcr) gene product is a member of a group of GTPase-activating proteins that act exclusively on members of the Ras-related Rho subfamily.

A complementary DNA was isolated from *Caenorhabditis elegans* that encoded a polypeptide of 1438 amino acid residues, CeGAP, which contains a domain with sequence

similarity to the COOH-terminal segment (GTPase-activating protein region) of Bcr and other known GTPase-activating proteins of the Rho subfamily. It also contains a "pleckstrin homology" motif, present in many signaling proteins including GTPase-activating proteins and nucleotide exchange factors. The Bcr-like domain of CeGAP exhibited activity not only on members of the *C. elegans* and human Rho subfamily but surprisingly also on *C. elegans* Ras protein (let-60), human Ras, and Rab3A.

CeGAP is therefore the first GTPase-activating protein acting on Ras-related proteins across different subfamilies. studies suggest a central and integrative role for CeGAP in a signaling pathway common to Ras and related proteins.

NOV86 is predicted to be expressed in at least the following tissues: pancreas, stomach, brain, bone. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV86 is provided in Example 2.

The NOV86 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hypercalcaemia, ulcers, diabetes, Von Hippel-Lindau (VHL) syndrome, pancreatitis, obesity as well as other diseases, disorders and conditions. NOV86 nucleic acids encoding the CeGAP-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a GTPase activating protein-like protein includes the nucleic acid whose sequence is provided in Table 86A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 86A while still encoding a protein that maintains its GTPase activating protein-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 86A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications

include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

5 In the mutant or variant nucleic acids, and their complements, up to about 1% of the bases may be so changed.

The novel protein of the invention includes the GTPase activating protein-like protein whose sequence is provided in Table 86B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 10 86B while still encoding a protein that maintains its GTPase activating protein-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 1% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic 15 methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV87

NOV87 includes two GTPase activating-like proteins, designated herein as NOV87a 20 and NOV87b.

### NOV87a

The disclosed NOV87a (alternatively referred to herein as CG56886-01) includes the 994 nucleotide sequence (SEQ ID NO:281) shown in Table 87A. A NOV87a ORF begins 25 with a Kozak consensus ATG initiation codon at nucleotides 16-18 and ends with a TGA codon at nucleotides 982-984. The disclosed NOV87a maps to human chromosome 17.

**Table 87A. NOV87a Nucleotide Sequence (SEQ ID NO:281)**

#### NOV87b

The disclosed NOV87b (alternatively referred to herein as CG56886-02) includes the 985 nucleotide sequence (SEQ ID NO:283) shown in Table 87C. A SEC2 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 7-9 and ends with a TGA codon at nucleotides 973-975. The disclosed NOV87b maps to human chromosome 17.

**Table 87C. NOV87b Nucleotide Sequence (SEQ ID NO:283)**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

The NOV87b polypeptide (SEQ ID NO:284) encoded by SEQ ID NO:283 is 322 amino acids in length and is presented using the one-letter amino acid code in Table 87D. The Psort profile for NOV87b predicts that this sequence has no signal peptide and is likely to be localized to the cytoplasm with a certainty of 0.6500.

A BLAST analysis of NOV87 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV87 had high  
5 homology to other proteins as shown in Table 87E.

**Table 87E. BLASTX results from PatP database for NOV87**

| Sequences producing High-scoring Segment Pairs:          | High Score | Smallest Sum     |
|----------------------------------------------------------|------------|------------------|
|                                                          |            | Probability P(N) |

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 276 of 417 bases (66%) identical to a gb:GENBANK-  
10 ID:BC006107|acc:BC006107.1 mRNA from *Homo sapiens* (*Homo sapiens*, clone MGC:12959, mRNA). The full amino acid sequence of the protein of the invention was found to have 173 of 319 amino acid residues (54%) identical to, and 229 of 319 amino acid residues (71%) similar to, the 316 amino acid residue ptmr:SPTREMBL-ACC:Q9NT76 protein from  
15 *Homo sapiens* (Human) (HYPOTHETICAL 36.4 KDA PROTEIN). NOV87 also has homology to the other proteins shown in the BLASTP data in Table 87F.

**Table 87F. NOV87 BLASTP results**

Rho GTPases control a variety of cellular processes. There are 3 subtypes of Rho GTPases in the Ras superfamily of small G proteins: RHO, RAC, and CDC42. GTPase-activating proteins (GAPs) bind activated forms of Rho GTPases and stimulate GTP hydrolysis. Through this catalytic function, Rho GAPs negatively regulate Rho-mediated signals. GAPs may also serve as effector molecules and play a role in signaling downstream of Rho and other Ras-like GTPases.

By screening a Jurkat cDNA library using a yeast 2-hybrid system with an activated form of RAC as bait, followed by screening a placenta cDNA library, Toure et al. (1998) isolated a cDNA encoding RACGAP1, which they called MGCRCACGAP. The predicted 527-amino acid RACGAP1 protein has a large N-terminal region containing a protein kinase C-like cysteine-rich motif. RACGAP1 shares highest homology with the Drosophila RnRacGAP and the chimerins of rat and human. Functional analysis showed that the GAP domain of RACGAP1 exhibits strong GAP activity towards CDC42, RAC1, and RAC2. Northern blot analysis detected an approximately 3.2-kb RACGAP1 transcript that was most abundantly expressed in testis, with low expression in most other tissues. Western blot analysis detected a

RACGAP1 protein of 58 kD in testis extracts. In situ hybridization showed that RACGAP1 expression is restricted to germ cells in mature testis Human breakpoint cluster region (bcr) gene product is a member of a group of GTPase-activating proteins that act exclusively on members of the Ras-related Rho subfamily.

5           A complementary DNA was isolated from *Caenorhabditis elegans* that encoded a polypeptide of 1438 amino acid residues, CeGAP, which contains a domain with sequence similarity to the COOH-terminal segment (GTPase-activating protein region) of Bcr and other known GTPase-activating proteins of the Rho subfamily. It also contains a "pleckstrin  
10           homology" motif, present in many signaling proteins including GTPase-activating proteins and nucleotide exchange factors. The Bcr-like domain of CeGAP exhibited activity not only on members of the *C. elegans* and human Rho subfamily but surprisingly also on *C. elegans* Ras protein (let-60), human Ras, and Rab3A.

          CeGAP is therefore the first GTPase-activating protein acting on Ras-related proteins across different subfamilies. studies suggest a central and integrative role for CeGAP in a  
15           signaling pathway common to Ras and related proteins.

          NOV87 is predicted to be expressed in at least the following tissues: pancreas, stomach, brain, bone. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for  
20           NOV87 is provided in Example 2.

          The NOV87 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia,  
25           leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hypercalcaemia, ulcers, diabetes, Von Hippel-Lindau (VHL) syndrome, pancreatitis, obesity as well as other diseases, disorders and conditions. NOV87 nucleic acids encoding the CeGAP-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be  
30           assessed.

          The novel nucleic acid of the invention encoding a GTPase activating protein-like protein includes the nucleic acid whose sequence is provided in Table 87A or 96C, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 87A or 96C while still

encoding a protein that maintains its GTPase activating protein-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 87A or 96C, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 1% of the bases may be so changed.

The novel protein of the invention includes the GTPase activating protein-like protein whose sequence is provided in Table 87B or 96D. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 87B or 96D while still encoding a protein that maintains its GTPase activating protein-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 1% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV88

The disclosed NOV88 (alternatively referred to herein as CG56394-01) includes the 1092 nucleotide sequence (SEQ ID NO:285) shown in Table 88A. A NOV88 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 25-27 and ends with a stop codon at nucleotides 1033-1035. The disclosed NOV88 maps to human chromosome 2.

A NOV88 polypeptide (SEQ ID NO:286) encoded by SEQ ID NO:285 is 336 amino acids in length and is presented using the one-letter amino acid code in Table 88B. The Psort profile for NOV88 predicts that this sequence has no signal peptide and is likely to be localized to microbodies with a certainty of 0.4804. In alternative embodiments, a NOV88 polypeptide is located to the mitochondrial matrix space with a certainty of 0.3600.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 928 of 1055 bases (87%) identical to a gb:GENBANK-ID:AF261085|acc:AF261085.1 mRNA from *Homo sapiens* (glyceraldehyde-3-phosphate dehydrogenase (GADPH) mRNA). The full amino acid sequence of the protein of the invention was found to have 278 of 336 amino acid residues (82%) identical to, and 294 of

336 amino acid residues (87%) similar to, the 335 amino acid residue ptnr:TREMBLNEW-ACC:AAG01996 protein from *Homo sapiens* (Human) (CLONE CDABP0047 MRNA SEQUENCE). NOV88 also has homology to the other proteins shown in the BLASTP data in Table 88D.

NAD-dependent glycerol-3-phosphate dehydrogenase (EC 1.1.1.8) (GPD) catalyzes the reversible reduction of dihydroxyacetone phosphate to glycerol-3-phosphate. It is a cytoplasmic protein that is active as a homodimer, with each monomer containing an N-terminal NAD binding site. In insects, it acts in conjunction with a mitochondrial alpha-glycerophosphate oxidase in the alpha-glycerophosphate cycle, which is essential for the production of energy used in insect flight.

Glyceraldehyde-3-phosphate dehydrogenase (EC 1.2.2.12) (GAPDH) mRNA levels, protein, and enzymatic activity increase in 3T3-F442A adipocytes after exposure to physiological concentrations of insulin (Alexander, M., Curtis, G., Avruch, J., and Goodman, H. (1985) *J. Biol. Chem.* 260, 11978-11985). In order to understand the mechanism of this regulation, researchers isolated and sequenced 5.4 kilobase pairs of a 12-kilobase pair human genomic clone encoding a functional GAPDH gene. The gene consists of 9 exons and 8 introns with eukaryotic signals necessary for the transcription and translation of GAPDH mRNA. The exon sequence confirms previously published cDNA sequences for human GAPDH in muscle, liver, and erythrocytes. The organization of the human and the unique chicken GAPDH genes is strikingly similar. Although chicken exons VIII-XI have been fused into human exon 8, introns which separate exons encoding the NAD binding, catalytic, and helical domains of the GAPDH protein have been retained. Stable transfection of rodent cells with the intact human GAPDH gene resulted in the expression of a correctly initiated human GAPDH mRNA and an enzymatically active human GAPDH polypeptide. Thus, the gene contains a functional promoter and intact coding sequences. Although many processed GAPDH pseudogenes and GAPDH-like sequences are present in the human genome, Southern blot analysis of human genomic DNA using a probe derived from the 3'-untranslated region of the GAPDH gene detected only two genes, a 10-copy processed pseudogene and a single copy of the isolated gene. In contrast, a probe derived from an intron segment of the isolated gene detected only a single copy of the GAPDH gene. Collectively, these findings strongly suggest that the human genome encodes a single functional GAPDH gene.

Hopkinson et al. (1974) presented evidence that glycerol-3-phosphate dehydrogenase (EC 1.1.1.8) is a dimer of dissimilar subunits. Electrophoretic variants at each of two loci, designated GPD1 and GPD2, were described. By the method of somatic cell hybridization, Kieley and Povey (1982) assigned the presumed structural gene for alpha-glycerophosphate dehydrogenase to chromosome 12. Since this is a liver-specific enzyme, a rat hepatoma cell line was used as one of the 'parents' in the hybridization.

NOV88 is predicted to be expressed in at least the following tissues: liver. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV88 is provided in Example 2.

The NOV88 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, cirrhosis, transplantation as well as other diseases, disorders and conditions. NOV88 nucleic acids encoding the Glycerol-3-Phosphate Dehydrogenase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a Glycerol-3-Phosphate Dehydrogenase-like protein includes the nucleic acid whose sequence is provided in Table 88A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 88A while still encoding a protein that maintains its Glycerol-3-Phosphate Dehydrogenase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 88A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 13% of the bases may be so changed.

The novel protein of the invention includes the Glycerol-3-Phosphate Dehydrogenase-like protein whose sequence is provided in Table 88B. The invention also includes a mutant or

variant protein any of whose residues may be changed from the corresponding residue shown in Table 88B while still encoding a protein that maintains its Glycerol-3-Phosphate Dehydrogenase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 18% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV89

The disclosed NOV89 (alternatively referred to herein as CG56396-01) includes the 1221 nucleotide sequence (SEQ ID NO:287) shown in Table 89A. A NOV89 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 25-27 and ends with a stop codon at nucleotides 1033-1035. The disclosed NOV89 maps to human chromosome 6.

**Table 89A. NOV89 Nucleotide Sequence (SEQ ID NO:287).**

A NOV89 polypeptide (SEQ ID NO:288) encoded by SEQ ID NO:287 is 374 amino acids in length and is presented using the one-letter amino acid code in Table 89B. The Psort profile for NOV89 predicts that this sequence is likely to be localized, to the endoplasmic reticulum (membrane) with a certainty of 0.5500, or to lysosomes with a certainty of 0.2630.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 1066 of 1225 bases (87%) identical to a gb:GENBANK-ID:AF261085|acc:AF261085.1 mRNA from *Homo sapiens* (glyceraldehyde-3-phosphate dehydrogenase (GADPH) mRNA). The full amino acid sequence of the protein of the invention was found to have 279 of 327 amino acid residues (85%) identical to, and 293 of 327 amino acid residues (89%) similar to, the 335 amino acid residue ptrn:TREMBLNEW-ACC:AAG01996 protein from *Homo sapiens* (Human) (CLONE CDABP0047 MRNA SEQUENCE). NOV89 also has homology to the other proteins shown in the BLASTP data in Table 89D.

Table 89F lists the domain description from DOMAIN analysis results against NOV89.

This indicates that the NOV89 sequence has properties similar to those of other proteins known to contain this domain.

5

NAD-dependent glycerol-3-phosphate dehydrogenase (EC 1.1.1.8) (GPD) catalyzes the reversible reduction of dihydroxyacetone phosphate to glycerol-3-phosphate. It is a cytoplasmic protein that is active as a homodimer, each monomer containing an N-terminal NAD binding site. In insects, it acts in conjunction with a mitochondrial alpha-glycerophosphate oxidase in the alpha-glycerophosphate cycle, which is essential for the production of energy used in insect flight.

Glyceraldehyde-3-phosphate dehydrogenase (EC 1.2.2.12) (GAPDH) mRNA levels, protein, and enzymatic activity increase in 3T3-F442A adipocytes after exposure to physiological concentrations of insulin (Alexander, M., Curtis, G., Avruch, J., and Goodman, H. (1985) *J. Biol. Chem.* 260, 11978-11985). In order to understand the mechanism of this regulation, researchers isolated and sequenced 5.4 kilobase pairs of a 12-kilobase pair human genomic clone encoding a functional GAPDH gene. The gene consists of 9 exons and 8 introns with eukaryotic signals necessary for the transcription and translation of GAPDH mRNA. The exon sequence confirms previously published cDNA sequences for human GAPDH in muscle, liver, and erythrocytes. The organization of the human and the unique chicken GAPDH genes is strikingly similar. Although chicken exons VIII-XI have been fused into human exon 8, introns which separate exons encoding the NAD binding, catalytic, and helical domains of the GAPDH protein have been retained. Stable transfection of rodent cells with the intact human GAPDH gene resulted in the expression of a correctly initiated human GAPDH mRNA and an enzymatically active human GAPDH polypeptide. Thus, the gene contains a functional promoter and intact coding sequences. Although many processed GAPDH pseudogenes and GAPDH-like sequences are present in the human genome, Southern blot analysis of human genomic DNA using a probe derived from the 3'-untranslated region of the GAPDH gene detected only two genes, a 10-copy processed pseudogene and a single copy of the isolated gene. In contrast, a probe derived from an intron segment of the isolated gene detected only a single copy of the GAPDH gene. Collectively, these findings strongly suggest that the human genome encodes a single functional GAPDH gene.

Hopkinson et al. (1974) presented evidence that glycerol-3-phosphate dehydrogenase (EC 1.1.1.8) is a dimer of dissimilar subunits. Electrophoretic variants at each of two loci, designated GPD1 and GPD2, were described. By the method of somatic cell hybridization, Kielty and Povey (1982) assigned the presumed structural gene for alpha-glycerophosphate dehydrogenase to chromosome 12. Since this is a liver-specific enzyme, a rat hepatoma cell line was used as one of the 'parents' in the hybridization.

NOV89 is predicted to be expressed in at least the following tissues: liver. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV89 is provided in Example 2.

5       The NOV89 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, cirrhosis, transplantation as well as other diseases, disorders and conditions. NOV89 nucleic acids encoding the Glycerol-3-Phosphate Dehydrogenase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications,  
10       wherein the presence or amount of the nucleic acid or the protein are to be assessed.

      The novel nucleic acid of the invention encoding a Glycerol-3-Phosphate Dehydrogenase-like protein includes the nucleic acid whose sequence is provided in Table 89A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 89A while still  
15       encoding a protein that maintains its Glycerol-3-Phosphate Dehydrogenase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 89A, including nucleic acid fragments that are complementary to any of the nucleic acids just described. The invention additionally includes nucleic acids or nucleic acid fragments, or complements  
20       thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant  
25       nucleic acids, and their complements, up to about 13% of the bases may be so changed.

      The novel protein of the invention includes the Glycerol-3-Phosphate Dehydrogenase-like protein whose sequence is provided in Table 89B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 89B while still encoding a protein that maintains its Glycerol-3-Phosphate  
30       Dehydrogenase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 15% of the amino acid residues may be so changed.

      These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using

prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV90

- 5 The disclosed NOV90 (alternatively referred to herein as CG56888-01) includes the 1686 nucleotide sequence (SEQ ID NO:289) shown in Table 90A. A NOV90 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 58-60 and ends with a stop codon at nucleotides 1630-1632. The disclosed NOV90 maps to human chromosome 3.

This BLASTP data is displayed graphically in the ClustalW in Table 90E. A multiple sequence alignment is given, with the NOV90 protein being shown on line 1 in a ClustalW analysis comparing the protein of the invention with the related protein sequences shown in

5 Table 90D.

| Table 90E. ClustalW Alignment of NOV90 |                                                     |

Serine/threonine kinases are an extensive family of enzymes that catalyzes the phosphorylation of serine or threonine residues on its target protein. Protein kinases share a conserved catalytic core common to both serine/ threonine and tyrosine protein kinases. This domain contains residues, which are specific to the distinct types of protein kinases

The S6/H4 kinase purified from human placenta catalyzes phosphorylation of the S6 ribosomal protein, histone H4, and myelin basic protein. In vitro activation of the p60 S6/H4 kinase requires removal of an autoinhibitory domain by mild trypsin digestion and autophosphorylation of the catalytic domain (p40 S6/H4 kinase). The two autophosphorylation/autoactivation sites contain the sequences SSMVGTPY (site 1) and SVIDPVPAPVGDSHVDGAAK (site 2). These sequences identify S6H4 kinase as the rac-activated PAK65 (Martin, G. A., Bollag, G., McCormick, F. and Abo, A. (1995) EMBO J. 14, 1971-1978). Site 1 phosphorylation is most rapid, but activation does not occur until site 2 is autophosphorylated. The site 1 phosphorylation occurs by an intramolecular mechanism whereas site 2 autophosphorylation occurs by an intermolecular mechanism. A model is proposed in which phosphorylation of sites 1 and 2 occurs sequentially. The model proposes that trypsin treatment of the inactive holoenzyme removes an inhibitory rac-binding domain which blocks MgATP access to the catalytic site. The pseudosubstrate domain at site 1 is autophosphorylated and subsequent bimolecular autophosphorylation at site 2 fully opens the catalytic site. Phosphorylation by a regulatory protein kinase may occur at site 2 in vivo.

NOV90 is predicted to be expressed in at least the following tissues: brain, cerebellum, skeletal muscle, ovary, thymus and spleen. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to

SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV90 is provided in Example 2.

The NOV90 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von  
5 Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation,  
10 immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV90 nucleic acids encoding the PAK2-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a serine/threonine-protein kinase  
15 PAK 2-like protein includes the nucleic acid whose sequence is provided in Table 90A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 90A while still encoding a protein that maintains its serine/threonine-protein kinase PAK 2-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes  
20 nucleic acids whose sequences are complementary to the sequence of Table 90A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar  
25 phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

The novel protein of the invention includes the serine/threonine-protein kinase PAK 2-like protein whose sequence is provided in Table 90B. The invention also includes a mutant or  
30 variant protein any of whose residues may be changed from the corresponding residue shown in Table 90B while still encoding a protein that maintains its serine/threonine-protein kinase PAK 2-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 6% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV91

The disclosed NOV91 (alternatively referred to herein as CG56779-01) includes the 404 nucleotide sequence (SEQ ID NO:291) shown in Table 91A. A NOV91 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 25-27 and ends with a stop codon at nucleotides 373-375. The disclosed NOV91n maps to human chromosome 3.

A NOV91 polypeptide (SEQ ID NO:292) encoded by SEQ ID NO:291 is 116 amino acids in length and is presented using the one-letter amino acid code in Table 91B. The Psort profile for NOV91 predicts that this sequence has no signal peptide and is likely to be localized to microbodies with a certainty of 0.6400. In alternative embodiments, a NOV91 polypeptide is located to the cytoplasm with a certainty of 0.4500.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 283 of 289 bases (97%) identical to a gb:GENBANK-ID:AP000500|acc:AP000500.1 mRNA from *Homo sapiens* (genomic DNA, chromosome 3p21.3, clone:603 to 320, anti-oncogene region, section 3/3). The full amino acid sequence of the protein of the invention was found to have 82 of 117 amino acid residues (70%) identical to, and 91 of 117 amino acid residues (77%) similar to, the 118 amino acid residue ptnr:pir-id:JE0162 protein from human (dopachrome Delta-isomerase (EC 5.3.3.12)). NOV91 also has homology to the other proteins shown in the BLASTP data in Table 91D.

D-Dopachrome tautomerase (DDT) shares a low homologous amino acid sequence (33% homology) with the macrophage migration inhibitory factor (MIF) yet possesses similar tautomerase activity. MIF is a cytokine involved in inflammatory reactions and immune responses. While MIF is a secreted protein, it is not processed from a larger precursor. Whereas recent studies have identified MIF as a pituitary hormone and immunoregulator, less is known about the structural basis of these physiological functions and the real significance of tautomerase activity. D-dopachrome tautomerase, which is related to MIF, is a mammalian cytoplasmic enzyme involved in melanin biosynthesis that tautomerizes 2-carboxy-2,3-

dihydroindole-5, 6-quinone (D-dopachrome) with concomitant decarboxylation to give 5,6-dihydroxyindole (DHI). It is a protein of 117 residues, and acts as a homotrimer.

NOV91 is predicted to be expressed in at least the following tissues: largely in the liver, and to lesser extent in other organs, including the heart, lung, pancreas; and placenta.

5 This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV91 is provided in Example 2.

The NOV91 nucleic acids and proteins are useful in potential therapeutic applications  
10 implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalceimia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic  
15 thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation, immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV91 nucleic acids encoding the D-Dopachrome tautomerase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

20 The novel nucleic acid of the invention encoding a D-dopachrome tautomerase-like protein includes the nucleic acid whose sequence is provided in Table 91A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 91A while still encoding a protein that maintains its D-dopachrome tautomerase-like activities and physiological functions, or a  
25 fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to those just described, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications  
30 include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

In the mutant or variant nucleic acids, and their complements, up to about 3% of the residues may be so changed.

The novel protein of the invention includes the D-dopachrome tautomerase-like protein whose sequence is provided in Table 91B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 91B while still encoding a protein that maintains its D-dopachrome tautomerase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 30% of the bases may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

## NOV92

The disclosed NOV92 (alternatively referred to herein as CG56904-01) includes the 1311 nucleotide sequence (SEQ ID NO:293) shown in Table 92A. A NOV92 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 19-21 and ends with a stop codon at nucleotides 1282-1284.

**Table 92A. NOV92 Nucleotide Sequence (SEQ ID NO:293)**

A NOV92 polypeptide (SEQ ID NO:294) encoded by SEQ ID NO:293 is 421 amino acids in length and is presented using the one-letter amino acid code in Table 92B. The Psort profile for NOV92 predicts that this sequence has a signal peptide and is likely to be secreted

with a certainty of 0.4419. The Signal P predicts a likely cleavage site for a NOV92 peptide is between positions 24 and 25, *i.e.*, at the dash in the sequence VAG-LE.

- 10 In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 1310 of 1312 bases (99%) identical to a gb:GENBANK-ID:AK027100|acc:AK027100.1 mRNA from *Homo sapiens* (cDNA: FLJ23447 fis, clone HSI03346). The full amino acid sequence of the protein of the invention was found to have 290 of 291 amino acid residues (99%) identical to, and 290 of 291 amino acid residues (99%) similar to, the 363 amino acid residue ptnr:TREMBLNEW-ACC:BAB15657 protein from
- 15 *Homo sapiens* (Human) (CDNA: FLJ23447 FIS, CLONE HSI03346). NOV92 also has homology to the other proteins shown in the BLASTP data in Table 92D.

Leucine-rich repeats (LRRs) are relatively short motifs (22-28 residues in length) found in a variety of cytoplasmic, membrane and extracellular proteins. Although these proteins are associated with widely different functions, a common property involves protein-protein interaction. Little is known about the 3D structure of LRRs, although it is believed that they can form amphipathic structures with hydrophobic surfaces capable of interacting with membranes. In vitro studies of a synthetic LRR from *Drosophila* Toll protein have indicated that the peptides form gels by adopting beta-sheet structures that form extended filaments. These results are consistent with the idea that LRRs mediate protein-protein interactions and

cellular adhesion. Other functions of LRR-containing proteins include, for example, binding to enzymes and vascular repair. The 3-D structure of ribonuclease inhibitor, a protein containing 15 LRRs, has been determined, revealing LRRs to be a new class of alpha/beta fold. LRRs form elongated non-globular structures and are often flanked by cysteine rich domains.

5 NOV92 is predicted to be expressed in at least the following tissues: colon, brain. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV92 is provided in Example 2.

The NOV92 nucleic acids and proteins are useful in potential therapeutic applications  
10 implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalceimia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic  
15 thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation, immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV92 nucleic acids encoding the LRR-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

20 The novel nucleic acid of the invention encoding a secreted leucine-rich repeat (LRR) protein-like protein includes the nucleic acid whose sequence is provided in Table 92A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 92A while still encoding a protein that maintains its secreted leucine-rich repeat (LRR) protein-like activities and  
25 physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 92A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications  
30 include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

In the mutant or variant nucleic acids, and their complements, up to about 1% of the bases may be so changed.

The novel protein of the invention includes the secreted leucine-rich repeat (LRR) protein-like protein whose sequence is provided in Table 92B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 92B while still encoding a protein that maintains its Secreted leucine-rich repeat (LRR) protein-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 1% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV93

The disclosed NOV93 (alternatively referred to herein as CG56277-01) includes the 1518 nucleotide sequence (SEQ ID NO:295) shown in Table 93A. A NOV93 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 2-4 and ends with a stop codon at nucleotides 1556-1558. The disclosed NOV93 maps to human chromosome 2.

A NOV93 polypeptide (SEQ ID NO:296) encoded by SEQ ID NO:295 is 518 amino acids in length and is presented using the one-letter amino acid code in Table 93B. The Psort profile for NOV93 predicts that this sequence is likely to be localized to the cytoplasm with a certainty of 0.4500. In alternative embodiments, a NOV93 polypeptide is located to  
 5 lysosomes with a certainty of 0.1921, or, to microbodies with a certainty of 0.3346.

A BLAST analysis of NOV93 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV93 had high  
 10 homology to other proteins as shown in Table 93C.

**Table 93C. BLASTX results from PatP database for NOV93**

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 1402 of 1567 bases (89%) identical to a gb:GENBANK-  
 15 ID:HUMIMPH|acc:J05272.1 mRNA from *Homo sapiens* (Human IMP dehydrogenase type 1 mRNA). The full amino acid sequence of the protein of the invention was found to have 438 of 513 amino acid residues (85%) identical to, and 462 of 513 amino acid residues (90%) similar to, the 514 amino acid residue ptnr:SWISSNEW-ACC:P20839 protein from *Homo sapiens* (Human) (INOSINE-5'-MONOPHOSPHATE DEHYDROGENASE 1 (EC 1.1.1.205) (IMP DEHYDROGENASE 1) (IMPDH-I) (IMPD 1)). NOV93 also has homology to the other  
 20 proteins shown in the BLASTP data in Table 93D.

Table 93F lists the domain description from DOMAIN analysis results against NOV93.

This indicates that the NOV93 sequence has properties similar to those of other proteins known to contain this domain.

5

| Table 93F. | <b>gnl Pfam pfam00478, IMPDH_C, IMP dehydrogenase / GMP reductase C terminus. This family is involved in biosynthesis of guanosine nucleotide biosynthesis. Members of this family contain a TIM barrel structure. The alignment does not contain the whole TIM barrel domain. The alignment is truncated after the insert domain (2 CBS domains pfam00571) found in the inosine-5'-monophosphate dehydrogenase structure. This family should always be associated with pfam01574. This family is a member of the common phosphate binding site TIM barrel family. SEQ ID NO:884</b> |                                                                  |

Inosine-5-prime-monophosphate dehydrogenase (EC 1.1.1.205) catalyzes the formation of xanthine monophosphate (XMP) from IMP. In the purine de novo synthetic pathway, IMP dehydrogenase is positioned at the branch point in the synthesis of adenine and guanine nucleotides and is thus the rate-limiting enzyme in the de novo synthesis of guanine nucleotides. Inhibition of cellular IMP dehydrogenase activity results in an abrupt cessation of DNA synthesis and a cell-cycle block at the G1-S interface. Collart and Huberman (1988) used a polyclonal antibody directed against the purified protein to isolate human and Chinese hamster IMP dehydrogenase cDNA clones. The sequence of these clones demonstrated an open reading frame for a protein containing 514 amino acids. The molecular mass of the

produced protein was 56 kD, which is the observed molecular mass of the purified protein and of the immunoprecipitated in vitro translation product.

A high order of conservation of the IMP dehydrogenase protein was indicated by the finding that human and Chinese hamster cDNA clones differed by only 8 amino acids.

5 Natsumeda et al. (1990) isolated two distinct cDNAs (types I and II) encoding IMP dehydrogenase from a human spleen cDNA library. Both clones encode proteins of 514 residues showing 84% sequence identity. Type I mRNA was found to be the main species in normal leukocytes, and type II (146691) predominated in human ovarian tumors. Using PCR primers specific for type II IMPDH, Glesne et al. (1993) screened a panel of human/Chinese  
10 hamster cell somatic hybrids and a separate deletion panel of chromosome 3 hybrids and localized the gene to 3p24.2-p21.2.

The gene was also localized on a map of two overlapping YACs and found to span no more than 12.5 kb of genomic DNA. From cloning and sequencing IMPD2, Glesne and Huberman (1994) determined that the gene spans approximately 5 kb and is interrupted by 12  
15 introns. The transcriptional start sites were determined by S1 nuclease mapping to be somewhat heterogeneous but the predominant mRNA species showed a 5-prime end at 102 and 85 nucleotides from the translational initiation codon. Zimmermann et al. (1995) also cloned the human gene and noted that it has 14 exons spanning approximately 5.8 kb. They also characterized regulatory elements in the 5-prime flanking region of the gene.

20 NOV93 is predicted to be expressed in at least the following tissues: brain, prosencephalon/forebrain, diencephalon, pituitary gland. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV93 is provided in Example 2.

25 The NOV93 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral  
30 disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation, immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV93 nucleic acids encoding the inosine-5-prime-monophosphate dehydrogenase-like protein of the invention, or fragments thereof, may further be useful in

diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a inosine-5'-monophosphate dehydrogenase-like protein includes the nucleic acid whose sequence is provided in Table 93A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 93A while still encoding a protein that maintains its inosine-5'-monophosphate dehydrogenase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 93A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 11% of the bases may be so changed.

The novel protein of the invention includes the inosine-5'-monophosphate dehydrogenase-like protein whose sequence is provided in Table 93B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 93B while still encoding a protein that maintains its inosine-5'-monophosphate dehydrogenase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 15% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts; as described in the "Anti-NOVX Antibodies" section below.

#### NOV94

The disclosed NOV94 (alternatively referred to herein as CG56281-01) includes the 1573 nucleotide sequence (SEQ ID NO:297) shown in Table 94A. A NOV94 ORF begins

with a Kozak consensus ATG initiation codon at nucleotides 1-3 and ends with a stop codon at nucleotides 1564-1566. The disclosed NOV94 maps to human chromosome 3.

- 5 A NOV94 polypeptide (SEQ ID NO:298) encoded by SEQ ID NO:297 is 521 amino acids in length and is presented using the one-letter amino acid code in Table 94B. The Psort profile for NOV94 predicts that this sequence is likely to be localized to the nucleus with a certainty of 0.9700. In alternative embodiments, a NOV94 polypeptide is localized to microbodies with a certainty of 0.3000.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 1381 of 1581 bases (87%) identical to a gb:GENBANK-ID:AF117065|acc:AF117065.1 mRNA from *Homo sapiens* (male-specific lethal-3 homolog 1 (MSL3L1) mRNA). The full amino acid sequence of the protein of the invention was found to have 414 of 520 amino acid residues (79%) identical to, and 457 of 520 amino acid residues (87%) similar to, the 521 amino acid residue ptnr:SPTREMBL-ACC:Q9Y5Z8 protein from *Homo sapiens* (Human) (MALE-SPECIFIC LETHAL-3 HOMOLOG 1). NOV94 also has homology to the other proteins shown in the BLASTP data in Table 94D.

10

Table 94F lists the domain description from DOMAIN analysis results against NOV94. This indicates that the NOV94 sequence has properties similar to those of other proteins known to contain this domain.

5

The Drosophila male-specific lethal (msl) genes regulate transcription from the male X chromosome in a dosage compensation pathway that equalizes X-linked gene expression in males and females. The members of this gene family, including msl1, msl2, msl3, mle, and mof, encode proteins with no sequence similarity to known proteins. However, mutations in

10

each of these genes produce a similar phenotype: sex-specific lethality of male embryos caused by the failure of mutants to increase transcription from the single male X chromosome.

The MSL gene products assemble into a multiprotein transcriptional activation complex at hundreds of sites along the chromatin of the X chromosome. By searching  
5 sequence databases with the sequence of a BAC clone that maps to Xp22.3, Prakash et al. (1999) identified a human homolog of *Drosophila msl3*, MSL3-like-1 (MSL3L1). They isolated a cDNA containing a complete MSL3L1 coding sequence. The deduced 521-amino acid MSL3L1 protein shares 30% overall sequence identity with *Drosophila* MSL3 and 86% identity with mouse Msl3l1. Three segments of the *Drosophila* MSL3 protein are highly  
10 conserved in MSL3L1, including two putative chromodomains, one at the N terminus and the other at the C terminus. Chromodomains, which form a characteristic tertiary structure and can interact with components of chromatin, have been implicated to play roles in chromatin organization and transcriptional regulation. MSL3L1 also contains a putative nuclear localization signal, a putative leucine zipper motif within the second chromodomain, and two  
15 potential tyrosine kinase phosphorylation sites.

Prakash et al. (1999) identified human fetal kidney cDNAs representing an alternatively spliced MSL3L1 transcript that lacks exon 2. The predicted protein, which is referred to as isoform 2, is identical to the first isoform from amino acid 62 to the C terminus but does not contain the first 26 amino acids of the N-terminal chromodomain. Northern blot  
20 analysis detected a major 2.4-kb MSL3L1 transcript in all tissues examined, namely liver, pancreas, heart, lung, kidney, skeletal muscle, brain, and placenta, with highest expression in skeletal muscle and heart. A 2.6-kb transcript unique to skeletal muscle was also found. Northern blot analysis of E7, E11, E15, and E17 mouse embryos detected approximately equal levels of Msl3l1 expression in all embryos. The MSL3L1 gene spans 17 kb and contains 13  
25 exons. It is transcribed from telomere to centromere. Prakash et al. (1999) showed that the MSL3L1 gene undergoes X inactivation.

NOV94 is predicted to be expressed in at least the following tissues: lung, testis, B-cell. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST  
30 sources, literature sources, and/or RACE sources. Further expression data for NOV94 is provided in Example 2.

The NOV94 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis,

hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation,

5 immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV94 nucleic acids encoding the MSL3L1-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a male-specific lethal 3-like 1-like

10 protein includes the nucleic acid whose sequence is provided in Table 94A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 94A while still encoding a protein that maintains its male-specific lethal 3-like 1-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences

15 are complementary to the sequence of Table 94A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar

20 phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 13% of the bases may be so changed.

25 The novel protein of the invention includes the male-specific lethal 3-like 1-like protein whose sequence is provided in Table 94B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 94B while still encoding a protein that maintains its male-specific lethal 3-like 1-like activities and physiological functions, or a functional fragment thereof. In the mutant or

30 variant protein, up to about 21% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using

prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV95

- 5 The disclosed NOV95 (alternatively referred to herein as CG56975-01) includes the 1323 nucleotide sequence (SEQ ID NO:299) shown in Table 95A. A NOV95 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 35-37 and ends with a stop codon at nucleotides 1301-1303. The disclosed NOV95 maps to human chromosome 1.

A NOV95 polypeptide (SEQ ID NO:300) encoded by SEQ ID NO:299 is 422 amino acids in length and is presented using the one-letter amino acid code in Table 95B. The Psort profile for NOV95 predicts that this sequence is a Type II membrane protein, and is likely to be localized at the plasma membrane with a certainty of 0.4400. In alternative embodiments, a

- 15 NOV95 polypeptide is located to microbodies with a certainty of 0.3691.

5

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 806 of 915 bases (88%) identical to a gb:GENBANK-ID:AF091090|acc:AF091090.1 mRNA from *Homo sapiens* (clone 669 unknown mRNA, complete sequence). The full amino acid sequence of the protein of the invention was found to have 229 of 415 amino acid residues (55%) identical to, and 300 of 415 amino acid residues (72%) similar to, the 419 amino acid residue ptmr:SPTREMBL-ACC:Q9W6U2 protein from *Fugu rubripes* (Japanese pufferfish) (*Takifugu rubripes*) (CYSTEINE CONJUGATE BETA-LYASE). NOV95 also has homology to the other proteins shown in the BLASTP data in Table 95D.

Aminotransferases share certain mechanistic features with other pyridoxal-phosphate dependent enzymes, such as the covalent binding of the pyridoxal-phosphate group to a lysine residue. On the basis of sequence similarity, these various enzymes can be grouped into subfamilies, one of which is the class I. Class I aminotransferases include cysteine conjugate beta-lyase. Living organisms employ a variety of metabolic pathways when detoxifying xenobiotic compounds, including the formation of cysteine S-conjugates via glutathione conjugation. Kidney cysteine conjugate beta-lyase (glutamine transaminase K, kyneurenine aminotransferase, EC 2.6.1.64) metabolises the cysteine conjugates of certain halogenated alkenes and alkanes to form reactive metabolites which can produce nephrotoxicity and neurotoxicity in experimental animals and man.

NOV95 is predicted to be expressed in at least the following tissues: kidney, liver, colon, gall bladder. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV95 is provided in Example 2.

The NOV95 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation, immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV95 nucleic acids encoding the aminotransferase-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a cysteine conjugate beta-lyase-like protein includes the nucleic acid whose sequence is provided in Table 95A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 95A while still encoding a protein  
5 that maintains its cysteine conjugate beta-lyase-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 95A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or  
10 complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.  
15 In the mutant or variant nucleic acids, and their complements, up to about 12% of the bases may be so changed.

The novel protein of the invention includes the cysteine conjugate beta-lyase-like protein whose sequence is provided in Table 95B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown  
20 in Table 95B while still encoding a protein that maintains its cysteine conjugate beta-lyase-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 45% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic  
25 methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### **NOV96**

NOV96 includes three monocarboxylate transporter-like proteins, designated herein as  
30 NOV96a, NOV96b and NOV96c.

#### *NOV96a*

The disclosed NOV96a (alternatively referred to herein as CG56918-01) includes the 1302 nucleotide sequence (SEQ ID NO:301) shown in Table 96A. A NOV96a ORF begins with a Kozak consensus ATG initiation codon at nucleotides 9-11 and ends with a stop codon at nucleotides 1287-1289. The disclosed NOV96a maps to human chromosome 17.

A NOV96a polypeptide (SEQ ID NO:302) encoded by SEQ ID NO:301 is 426 amino acids in length and is presented using the one-letter amino acid code in Table 96B. The Psort profile for NOV96a predicts that this sequence is a Type IIIa membrane protein, has a signal peptide, and is likely to be localized to the plasma membrane with a certainty of 0.6400. In alternative embodiments, a NOV96a polypeptide is located to the Golgi with a certainty of 0.4600, or to the endoplasmic reticulum (membrane) with a certainty of 0.3700. The Signal P predicts a likely cleavage site for a NOV96a peptide is between positions 34 and 35, *i.e.*, at the dash in the sequence VAA-FE.

## NOV96b

The disclosed NOV96b (alternatively referred to herein as CG56918-02) includes the 1294' nucleotide sequence (SEQ ID NO:303) shown in Table 96C. A SEC2 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 1-3 and ends with a TGA codon at nucleotides 1279-1281. The disclosed NOV96b maps to human chromosome 17.

A NOV96b polypeptide (SEQ ID NO:304) encoded by SEQ ID NO:303 is 426 amino acids in length and is presented using the one-letter amino acid code in Table 96D. The Psort profile for NOV96b predicts that this sequence is likely to be a Type IIIa membrane protein, has a signal peptide, and is likely to be localized to the plasma membrane with a certainty of 0.6400. In alternative embodiments, a NOV96b polypeptide is located to the Golgi with a certainty of 0.4600, or to the endoplasmic reticulum (membrane) with a certainty of 0.3700. The Signal P predicts a likely cleavage site for a NOV96b peptide is between positions 44 and 45, i.e., at the dash in the sequence VAA-FE.

NOV96c

The disclosed NOV96c (alternatively referred to herein as CG56918-03) includes the 1445 nucleotide sequence (SEQ ID NO:305) shown in Table 96E. A SEC2 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 9-11 and ends with a stop codon at nucleotides 1287-1289. The disclosed NOV96c maps to human chromosome 17.

The NOV96c polypeptide (SEQ ID NO:306) encoded by SEQ ID NO:305 is 426 amino acids in length and is presented using the one-letter amino acid code in Table 96F. The Psort profile for NOV96c predicts that this sequence is a Type III a membrane protein, has a signal peptide, and is likely to be localized to the plasma membrane with a certainty of 0.6400. In alternative embodiments, a NOV96c polypeptide is located to the Golgi with a certainty of 0.4600, or to the endoplasmic reticulum (membrane) with a certainty of 0.3700. The Signal P predicts a likely cleavage site for a NOV96c peptide is between positions 34 and 35, *i.e.*, at the dash in the sequence VAA-FE.

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 420 of 702 bases (59%) identical to a gb:GENBANK-ID:RNU87627|acc:U87627.1 mRNA from *Rattus norvegicus* (*Rattus norvegicus* putative monocarboxylate transporter (MCT3) mRNA). The full amino acid sequence of the protein of the invention was found to have 89 of 191 amino acid residues (46%) identical to, and 119 of 191 amino acid residues (62%) similar to, the 504 amino acid residue ptnr:SPTREMBL-ACC:O95907 protein from *Homo sapiens* (Human) (DJ1039K5.2 (SIMILAR TO MONOCARBOXYLATE TRANSPORTER (MCT3)). NOV96 also has homology to the other proteins shown in the BLASTP data in Table 96H.

Monocarboxylates such as lactate and pyruvate play a central role in cellular metabolism and metabolic communication between tissues. Essential to these roles is their rapid transport across the plasma membrane, which is catalysed by a recently identified family of proton-linked monocarboxylate transporters (MCTs). Nine MCT-related sequences have so far been identified in mammals, each having a different tissue distribution, whereas six related proteins can be recognized in *Caenorhabditis elegans* and four in *Saccharomyces cerevisiae*.

Direct demonstration of proton-linked lactate and pyruvate transport has been demonstrated for mammalian MCT1-MCT4, but only for MCT1 and MCT2 have detailed analyses of substrate and inhibitor kinetics been described following heterologous expression in *Xenopus* oocytes. MCT1 is ubiquitously expressed, but is especially prominent in heart and red muscle, where it is up-regulated in response to increased work, suggesting a special role in lactic acid oxidation. By contrast, MCT4 is most evident in white muscle and other cells with a high glycolytic rate, such as tumour cells and white blood cells, suggesting it is expressed where lactic acid efflux predominates. MCT2 has a ten-fold higher affinity for substrates than MCT1 and MCT4 and is found in cells where rapid uptake at low substrate concentrations may be required, including the proximal kidney tubules, neurons and sperm tails. MCT3 is uniquely expressed in the retinal pigment epithelium. MCT1 and MCT4 have been shown to interact specifically with OX-47 (CD147), a member of the immunoglobulin superfamily with a single transmembrane helix. This interaction appears to assist MCT expression at the cell surface (Halestrap and Price, 1999, *Biochem. J.* vol.343: 281-99).

NOV96 is predicted to be expressed in at least the following tissues: adrenal gland, bone marrow, brain - amygdala, brain - cerebellum, brain - hippocampus, brain - substantia nigra, brain - thalamus, brain - whole, fetal brain, fetal kidney, fetal liver, fetal lung, foreskin, heart, kidney, lymphoma - Raji, mammary gland, pancreas, pituitary gland, placenta, prostate, salivary gland, skeletal muscle, small intestine, spinal cord, spleen, stomach, testis, thyroid, trachea and uterus. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources,

public EST sources, literature sources, and/or RACE sources. Further expression data for NOV96 is provided in Example 2.

The NOV96 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von  
5 Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation,  
10 immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV96 nucleic acids encoding the monocarboxylate transporter-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a monocarboxylate transporter-like  
15 protein includes the nucleic acid whose sequence is provided in Table 96A, 105C, or 105E, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 96A, 105C, or 105E while still encoding a protein that maintains its monocarboxylate transporter-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes  
20 nucleic acids whose sequences are complementary to the sequence of Table 96A, 105C, or 105E, including nucleic acid fragments that are complementary to any of the nucleic acids just described. The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar  
25 phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 41% of the bases may be so changed.

30 The novel protein of the invention includes the monocarboxylate transporter-like protein whose sequence is provided in Table 96B, 105D, or 105F. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 96B, 105D, or 105F while still encoding a protein that maintains its monocarboxylate transporter-like activities and physiological functions, or a functional

fragment thereof. In the mutant or variant protein, up to about 54% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV97

NOV97 includes six carboxypeptidase-like proteins, designated herein as NOV97a, NOV97b, NOV97c, NOV97d, NOV97e, and NOV97f.

#### NOV97a

The disclosed NOV97a (alternatively referred to herein as CG57070-01) includes the 1279 nucleotide sequence (SEQ ID NO:307) shown in Table 97A. A NOV97a ORF begins with a Kozak consensus ATG initiation codon at nucleotides 1-3 and ends with a stop codon at nucleotides 1258-1260. The disclosed NOV97a maps to human chromosome 7q 31.

A NOV97a polypeptide (SEQ ID NO:308) encoded by SEQ ID NO:307 is 419 amino acids in length and is presented using the one-letter amino acid code in Table 97B. The Psort profile for NOV97a predicts that this sequence has a signal peptide and is likely to be

localized outside the cell with a certainty of 0.3703. In alternative embodiments, a NOV97a polypeptide is located to lysosomes with a certainty of 0.46200. The Signal P predicts a likely cleavage site for a NOV97a peptide is between positions 16 and 17, *i.e.*, at the dash in the sequence VFG-KE.

### NOV97b

The disclosed NOV97b (alternatively referred to herein as CG57070-02) includes the 1291 nucleotide sequence (SEQ ID NO:309) shown in Table 97C. A SEC2 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 1-3 and ends with a stop codon at nucleotides 1270-1272. The disclosed NOV97b maps to human chromosome 7q31.

A NOV97d polypeptide (SEQ ID NO:314) encoded by SEQ ID NO:313 is 324 amino acids in length and is presented using the one-letter amino acid code in Table 97H. The Psort profile for NOV97d predicts that this sequence has a signal peptide and is likely to be localized to lysosomes with a certainty of 0.4757, or outside the cell with a certainty of

0.3703. The Signal P predicts a likely cleavage site for a NOV97d peptide is between positions 16 and 17, *i.e.*, at the dash in the sequence VFG-KE.

# 5 NOV97e

The disclosed NOV97e (alternatively referred to herein as CG57070-05) includes the 1348 nucleotide sequence (SEQ ID NO:315) shown in Table 97I. A NOV97e ORF begins with a Kozak consensus ATG initiation codon at nucleotides 25-27 and ends with a stop codon at nucleotides 1333-1335. The disclosed NOV97e maps to human chromosome 7.

A NOV97e polypeptide (SEQ ID NO:316) encoded by SEQ ID NO:315 is 436 amino acids in length and is presented using the one-letter amino acid code in Table 97J. The Psort profile for NOV97e predicts that this sequence has a signal peptide and is likely to be localized outside the cell with a certainty of 0.5851. In alternative embodiments, a NOV97e polypeptide is located to lysosomes with a certainty of 0.4421. The Signal P predicts a likely

cleavage site for a NOV97e peptide is between positions 33 and 34, *i.e.*, at the dash in the sequence ALG-QM.

### NOV97f

The disclosed NOV97f (alternatively referred to herein as CG57070-06) includes the 975 nucleotide sequence (SEQ ID NO:317) shown in Table 97K. A SEC2 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 1-3 and ends with a TAG codon at nucleotides 973-975. The disclosed NOV97f maps to human chromosome 7q31.

A NOV97f polypeptide (SEQ ID NO:318) encoded by SEQ ID NO:317 is 324 amino acids in length and is presented using the one-letter amino acid code in Table 97L. The Psort profile for NOV97f predicts that this sequence has a signal peptide and is likely to be localized outside the cell with a certainty of 0.3989. In alternative embodiments, a NOV97f polypeptide is located to lysosomes with a certainty of 0.5061. The Signal P predicts a likely cleavage site for a NOV97f peptide is between positions 16 and 17, *i.e.*, at the dash in the sequence VFG-KE.

A BLAST analysis of NOV97 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV97 had high  
5 homology to other proteins as shown in Table 97M.

**Table 97M. BLASTX results from PatP database for NOV97**

| Sequences producing High-scoring Segment Pairs: | High Score | Smallest Sum     |
|-------------------------------------------------|------------|------------------|
|                                                 |            | Probability P(N) |

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 1017 of 1264 bases (80%) identical to a gb:GENBANK-  
10 ID:HSPCBXA1|acc:X67318.1 mRNA from *Homo sapiens* (H.sapiens mRNA for procarboxypeptidase A1). The full amino acid sequence of the protein of the invention was found to have 315 of 419 amino acid residues (75%) identical to, and 357 of 419 amino acid residues (85%) similar to, the 419 amino acid residue ptmr:SWISSNEW-ACC:P15085 protein from *Homo sapiens* (Human) (CARBOXYPEPTIDASE A1 PRECURSOR (EC 3.4.17.1)).  
15 NOV97 also has homology to the other proteins shown in the BLASTP data in Table 97N.

**Table 97N. NOV97 BLASTP results**

Carboxypeptidase A (EC 3.4.2.1) is a pancreatic exopeptidase. Three different forms of human pancreatic procarboxypeptidase A have been isolated. The A1 and A2 (600688) forms are monomeric proteins with different biochemical properties. Honey et al. (1984, 1986) found that an 8.6-kb human DNA fragment (detected by means of a rat cDNA probe for CPA) cosegregated with chromosome 7. The assignment was narrowed by demonstration of absence

of the human DNA fragment in cells with a deletion of 7q22-qter. By studying mouse-hamster hybrid cells, Honey et al. (1986) assigned the CPA gene to mouse chromosome 6. Trypsin (276000) is also on human 7q22-qter and on mouse 6. Stewart et al. (1990) concluded from multipoint linkage analysis with established chromosome 7 markers that the most likely  
5 location of carboxypeptidase is 7q31-qter. It lies distal to cystic fibrosis at a distance of approximately 12 cM.

NOV97 is predicted to be expressed in at least the following tissues: pancreas. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature  
10 sources, and/or RACE sources. Further expression data for NOV97 is provided in Example 2.

The NOV97 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-  
15 Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation, immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV97 nucleic acids encoding the carboxypeptidase-like protein of the invention,  
20 or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a carboxypeptidase A1-like protein includes the nucleic acid whose sequence is provided in Table 97A, 97C, 97E, 97G, 97I, or 97K or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of  
25 whose bases may be changed from the corresponding base shown in Table 97A, 97C, 97E, 97G, 97I, or 97K while still encoding a protein that maintains its carboxypeptidase A1-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequences of Table 97A, 97C, 97E, 97G, 97I, or 97K, including nucleic acid fragments that are complementary to  
30 any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least

in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject. In the mutant or variant nucleic acids, and their complements, up to about 20% of the bases may be so changed.

5       The novel protein of the invention includes the carboxypeptidase A1-like protein whose sequence is provided in Table 97B, 97D, 97F, 97H, 97J, or 97L. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 97B, 97D, 97F, 97H, 97J, or 97L while still encoding a protein that maintains its carboxypeptidase A1-like activities and physiological functions, or a  
10 functional fragment thereof. In the mutant or variant protein, up to about 25% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using  
15 prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### NOV98

The disclosed NOV98 (alternatively referred to herein as CG56939-01) includes the  
20 5583 nucleotide sequence (SEQ ID NO:319) shown in Table 98A. A NOV98 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 1-3 and ends with a TGA codon at nucleotides 4630-4632. The disclosed NOV98 maps to human chromosome 1.

A NOV98 polypeptide (SEQ ID NO:320) encoded by SEQ ID NO:319 is 1543 amino acids in length and is presented using the one-letter amino acid code in Table 98B. The Psort profile for NOV98 predicts that this sequence has no signal peptide and is likely to be localized to the cytoplasm with a certainty of 0.4500. In alternative embodiments, a NOV98 polypeptide is located to microbodies with a certainty of 0.3000.

**Table 98B. NOV98 Polypeptide Sequence (SEQ ID NO:320)**

A BLAST analysis of NOV98 was run against the proprietary PatP GENESEQ Protein Patent database. It was found, for example, that the amino acid sequence of NOV98 had high homology to other proteins as shown in Table 98C.

**Table 98C. BLASTX results from PatP database for NOV98**

| Sequences producing High-scoring Segment Pairs:           | High Score | Smallest Sum     |
|-----------------------------------------------------------|------------|------------------|
|                                                           |            | Probability P(N) |

In a search of sequence databases, it was found, for example, that the nucleic acid sequence of this invention has 3158 of 3416 bases (92%) identical to a gb:GENBANK-ID:AF016903|acc:AF016903.1 mRNA from *Homo sapiens* (agrin precursor mRNA). The full amino acid sequence of the protein of the invention was found to have 1092 of 1114 amino acid residues (98%) identical to, and 1093 of 1114 amino acid residues (98%) similar to, the 2026 amino acid residue ptrn:SPTREMBL-ACC:O00468 protein from *Homo sapiens* (Human) (AGRIN PRECURSOR). NOV98 also has homology to the other proteins shown in the BLASTP data in Table 98D.

Table 98F lists the domain description from DOMAIN analysis results against NOV98.

This indicates that the NOV98 sequence has properties similar to those of other proteins known to contain this domain.

5

Synapses are essential relay stations for the transmission of information between neurones and other cells. An ordered and tightly regulated formation of these structures is crucial for the functioning of the nervous system. The synapse is also involved in perception, learning and memory. Understanding the sequence of steps that is involved in establishing

10

synapses during development might also help to understand mechanisms that cause changes in synapses during learning and memory.

For practical reasons, most of the current knowledge of synapse development is derived from studies of the vertebrate neuromuscular junction. Upon arrival of a motor axon at the muscle fiber, signals released from its growth cone initiate the formation of a synapse. This process consists of two stages: arrest of axon growth at the target area and differentiation of pre- and postsynaptic cells at the site of nerve-muscle contact.

Studies of regenerating neuromuscular junctions in vertebrates have revealed that important signals for the formation of this synapse are located in the synaptic basal lamina, and attempts to identify these signals have led to the isolation of agrin and other components. The induction of the intensively studied synapse between nerve and muscle is initiated by the binding of neuron-specific isoforms of the basal membrane protein agrin to receptors on the surface of myotubes. Agrin activates a receptor complex that includes the muscle-specific kinase and most likely additional, yet to be identified, components. Receptor activation leads to the aggregation of acetylcholine receptors (AChR) and other proteins of the postsynaptic apparatus. This activation process has unique features which distinguish it from other receptor tyrosine kinases. In particular, the autophosphorylation of the kinase domain, which usually induces the recruitment of adaptor and signalling molecules, is not sufficient for AChR aggregation. Apparently, interactions of the extracellular domain with unknown components are also required for this process.

Agrin binds to a second protein complex on the muscle surface known as the dystrophin-associated glycoprotein complex. This binding forms one end of a molecular link between the extracellular matrix and the cytoskeleton.

While many components of the machinery triggering postsynaptic differentiation have now been identified, the picture of the molecular pathway causing the redistribution of synaptic proteins is still incomplete. Recent advances implicate proteins such as dystroglycan, MuSK, and rapsyn in the transduction of agrin signals. Additional functions of agrin have been discovered, including the upregulation of gene transcription in myonuclei and the control of presynaptic differentiation.

Agrin therefore appears to play a unique role in controlling synaptic differentiation on both sides of the neuromuscular junction.

NOV98 is predicted to be expressed in at least the following tissues: adrenal gland, bone marrow, brain - amygdala, brain - cerebellum, brain - hippocampus, brain - substantia nigra, brain - thalamus, brain -whole, fetal brain, fetal kidney, fetal liver, fetal lung, heart,

kidney, lymphoma - Raji, mammary gland, pancreas, pituitary gland, placenta, prostate, salivary gland, skeletal muscle, small intestine, spinal cord, spleen, stomach, testis, thyroid, trachea and uterus, bone, cerebral medulla/ cerebral white matter, cervix, colon, epidermis, foreskin, hair follicles, liver, lung, lymphoid tissue, ovary, parathyroid gland, parietal lobe, retina, skin, vein, whole organism. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV98 is provided in Example 2.

The NOV98 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation, immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV98 nucleic acids encoding the agrin-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a agrin-like protein includes the nucleic acid whose sequence is provided in Table 98B, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 98B while still encoding a protein that maintains its agrin-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 98B, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

In the mutant or variant nucleic acids, and their complements, up to about 8% of the bases may be so changed.

The novel protein of the invention includes the agrin-like protein whose sequence is provided in Table 98B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 98B while still encoding a protein that maintains its agrin-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 2% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

#### NOV99

The disclosed NOV99 (alternatively referred to herein as CG57010-01) includes the 1513 nucleotide sequence (SEQ ID NO:321) shown in Table 99A. A NOV99 ORF begins with a Kozak consensus ATG initiation codon at nucleotides 396-398 and ends with a TGA codon at nucleotides 1410-1412. The disclosed NOV99 maps to human chromosome 14q32.33.

A NOV99 polypeptide (SEQ ID NO:322) encoded by SEQ ID NO:321 is 338 amino acids in length and is presented using the one-letter amino acid code in Table 99B. The Psort profile for NOV99 predicts that this sequence has no signal peptide and is likely to be  
 5 localized to the cytoplasm with a certainty of 0.4500. In alternative embodiments, a NOV99 polypeptide is located to microbodies with a certainty of 0.1315.

A BLAST analysis of NOV99 was run against the proprietary PatP GENESEQ Protein  
 10 Patent database. It was found, for example, that the amino acid sequence of NOV99 had high homology to other proteins as shown in Table 99C.

**Table 99C. BLASTX results from PatP database for NOV99**

| Sequences producing High-scoring Segment Pairs:                   | High<br>Score | Smallest<br>Sum      |

In a search of sequence databases, it was found, for example, that the nucleic acid  
 15 sequence of this invention has 1122 of 1133 bases (99%) identical to a gb:GENBANK-  
 ID:AF067420|acc:AF067420.1 mRNA from *Homo sapiens* (SNC73 protein (SNC73) mRNA).  
 The full amino acid sequence of the protein of the invention was found to have 244 of 253  
 amino acid residues (96%) identical to, and 247 of 253 amino acid residues (97%) similar to,  
 the 384 amino acid residue ptrn:SPTREMBL-ACC:Q9UP60 protein from *Homo sapiens*  
 20 (Human) (SNC73 PROTEIN)(Fig. 3B). In addition to smaller changes, the sequence of this  
 invention lacks 46 internal amino acids, when compared to ptrn:SPTREMBL-ACC:Q9UP60

protein from *Homo sapiens* (Human) (SNC73 PROTEIN). NOV99 also has homology to the other proteins shown in the BLASTP data in Table 99D.

SNC73. was identified by subtractive hybridization between normal mucosa and colorectal cancer tissue as a gene which is down-regulated in colorectal cancer. It is highly homologous to the constant region of immunoglobulin alpha-1 chain. In higher vertebrates there are five classes of antibodies, IgA, IgD, IgE, IgG, and IgM, each with its own class of

heavy chain - alpha, delta, epsilon, gamma, and mu, respectively. IgA molecules have alpha chains, IgG molecules have gamma chains, and so on. In addition, there are a number of subclasses of IgG and IgA immunoglobulins; for example, there are four human IgG subclasses (IgG1, IgG2, IgG3, and IgG4) having gamma1, gamma2, gamma3, and gamma4 heavy chains, respectively.

The various heavy chains impart a distinctive conformation to the hinge and tail regions of antibodies and give each class (and subclass) characteristic properties of its own. IgA is the principal class of antibody in secretions (saliva, tears, milk, and respiratory and intestinal secretions). It is transported through secretory epithelial cells from the extracellular fluid into the secreted fluid by the Poly Ig receptor, another type of Fc receptor that is unique to secretory epithelia. IgA serves both to defend against local infection and to prevent access of foreign antigens to the general immunologic system. This function is in accord with the potential role of SNC73 in colorectal cancer.

NOV99 is predicted to be expressed in at least the following tissues: adrenal gland, bone marrow, brain - amygdala, brain - cerebellum, brain - hippocampus, brain - substantia nigra, brain - thalamus, brain - whole, fetal brain, fetal kidney, fetal liver, fetal lung, heart, kidney, lymphoma - Raji, mammary gland, pancreas, pituitary gland, placenta, prostate, salivary gland, skeletal muscle, small intestine, spinal cord, spleen, stomach, testis, thyroid, trachea and uterus. This information was derived by determining the tissue sources of the sequences that were included in the invention including but not limited to SeqCalling sources, public EST sources, literature sources, and/or RACE sources. Further expression data for NOV99 is provided in Example 2.

The NOV99 nucleic acids and proteins are useful in potential therapeutic applications implicated in various pathological disorders described further herein, for example, Von Hippel-Lindau (VHL) syndrome, Alzheimer's disease, stroke, tuberous sclerosis, hypercalcaemia, Parkinson's disease, Huntington's disease, cerebral palsy, epilepsy, Lesch-Nyhan syndrome, multiple sclerosis, ataxia-telangiectasia, leukodystrophies, behavioral disorders, addiction, anxiety, pain, neuroprotection, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, hemophilia, hypercoagulation, immunodeficiencies, graft versus host disease as well as other diseases, disorders and conditions. NOV99 nucleic acids encoding the SNC73-like protein of the invention, or fragments thereof, may further be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed.

The novel nucleic acid of the invention encoding a SNC73-like protein includes the nucleic acid whose sequence is provided in Table 99A, or a fragment thereof. The invention also includes a mutant or variant nucleic acid any of whose bases may be changed from the corresponding base shown in Table 99A while still encoding a protein that maintains its  
5 SNC73-like activities and physiological functions, or a fragment of such a nucleic acid. The invention further includes nucleic acids whose sequences are complementary to the sequence of Table 99A, including nucleic acid fragments that are complementary to any of the nucleic acids just described.

The invention additionally includes nucleic acids or nucleic acid fragments, or  
10 complements thereto, whose structures include chemical modifications. Such modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.  
15 In the mutant or variant nucleic acids, and their complements, up to about 1% of the bases may be so changed.

The novel protein of the invention includes the SNC73-like protein whose sequence is provided in Table 99B. The invention also includes a mutant or variant protein any of whose residues may be changed from the corresponding residue shown in Table 99B while still  
20 encoding a protein that maintains its SNC73-like activities and physiological functions, or a functional fragment thereof. In the mutant or variant protein, up to about 4% of the amino acid residues may be so changed.

These materials are further useful in the generation of antibodies that bind immunospecifically to the substances of the invention for use in therapeutic or diagnostic  
25 methods. These antibodies may be generated according to methods known in the art, using prediction from hydrophobicity charts, as described in the "Anti-NOVX Antibodies" section below.

### **NOVX Nucleic Acids and Polypeptides**

30 One aspect of the invention pertains to isolated nucleic acid molecules that encode NOVX polypeptides or biologically active portions thereof. Also included in the invention are

nucleic acid fragments sufficient for use as hybridization probes to identify NOVX-encoding nucleic acids (*e.g.*, NOVX mRNAs) and fragments for use as PCR primers for the amplification and/or mutation of NOVX nucleic acid molecules. As used herein, the term “nucleic acid molecule” is intended to include DNA molecules (*e.g.*, cDNA or genomic  
5 DNA), RNA molecules (*e.g.*, mRNA), analogs of the DNA or RNA generated using nucleotide analogs, and derivatives, fragments and homologs thereof. The nucleic acid molecule may be single-stranded or double-stranded, but preferably is comprised double-stranded DNA.

An NOVX nucleic acid can encode a mature NOVX polypeptide. As used herein, a  
10 “mature” form of a polypeptide or protein disclosed in the present invention is the product of a naturally occurring polypeptide or precursor form or proprotein. The naturally occurring polypeptide, precursor or proprotein includes, by way of nonlimiting example, the full-length gene product, encoded by the corresponding gene. Alternatively, it may be defined as the polypeptide, precursor or proprotein encoded by an ORF described herein. The product  
15 “mature” form arises, again by way of nonlimiting example, as a result of one or more naturally occurring processing steps as they may take place within the cell, or host cell, in which the gene product arises. Examples of such processing steps leading to a “mature” form of a polypeptide or protein include the cleavage of the N-terminal methionine residue encoded by the initiation codon of an ORF, or the proteolytic cleavage of a signal peptide or leader  
20 sequence. Thus a mature form arising from a precursor polypeptide or protein that has residues 1 to N, where residue 1 is the N-terminal methionine, would have residues 2 through N remaining after removal of the N-terminal methionine. Alternatively, a mature form arising from a precursor polypeptide or protein having residues 1 to N, in which an N-terminal signal sequence from residue 1 to residue M is cleaved, would have the residues from residue M+1 to  
25 residue N remaining. Further as used herein, a “mature” form of a polypeptide or protein may arise from a step of post-translational modification other than a proteolytic cleavage event. Such additional processes include, by way of non-limiting example, glycosylation, myristoylation or phosphorylation. In general, a mature polypeptide or protein may result from the operation of only one of these processes, or a combination of any of them.

30 The term “probes”, as utilized herein, refers to nucleic acid sequences of variable length, preferably between at least about 10 nucleotides (nt), 100 nt, or as many as approximately, *e.g.*, 6,000 nt, depending upon the specific use. Probes are used in the detection of identical, similar, or complementary nucleic acid sequences. Longer length probes are generally obtained from a natural or recombinant source, are highly specific, and

much slower to hybridize than shorter-length oligomer probes. Probes may be single- or double-stranded and designed to have specificity in PCR, membrane-based hybridization technologies, or ELISA-like technologies.

The term "isolated" nucleic acid molecule, as utilized herein, is one, which is separated  
5 from other nucleic acid molecules which are present in the natural source of the nucleic acid. Preferably, an "isolated" nucleic acid is free of sequences which naturally flank the nucleic acid (*i.e.*, sequences located at the 5'- and 3'-termini of the nucleic acid) in the genomic DNA of the organism from which the nucleic acid is derived. For example, in various embodiments, the isolated NOVX nucleic acid molecules can contain less than about 5 kb, 4 kb, 3 kb, 2 kb, 1  
10 kb, 0.5 kb or 0.1 kb of nucleotide sequences which naturally flank the nucleic acid molecule in genomic DNA of the cell/tissue from which the nucleic acid is derived (*e.g.*, brain, heart, liver, spleen, etc.). Moreover, an "isolated" nucleic acid molecule, such as a cDNA molecule, can be substantially free of other cellular material or culture medium when produced by recombinant techniques, or of chemical precursors or other chemicals when chemically  
15 synthesized.

A nucleic acid molecule of the invention, *e.g.*, a nucleic acid molecule having the nucleotide sequence SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, or a complement of this aforementioned nucleotide sequence, can be isolated using standard molecular biology techniques and the sequence information provided herein. Using all or a  
20 portion of the nucleic acid sequence of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 as a hybridization probe, NOVX molecules can be isolated using standard hybridization and cloning techniques (*e.g.*, as described in Sambrook, *et al.*, (eds.), MOLECULAR CLONING: A LABORATORY MANUAL 2<sup>nd</sup> Ed., Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, 1989; and Ausubel, *et al.*, (eds.), CURRENT PROTOCOLS IN  
25 MOLECULAR BIOLOGY, John Wiley & Sons, New York, NY, 1993.)

A nucleic acid of the invention can be amplified using cDNA, mRNA or alternatively, genomic DNA, as a template and appropriate oligonucleotide primers according to standard PCR amplification techniques. The nucleic acid so amplified can be cloned into an appropriate vector and characterized by DNA sequence analysis. Furthermore,  
30 oligonucleotides corresponding to NOVX nucleotide sequences can be prepared by standard synthetic techniques, *e.g.*, using an automated DNA synthesizer.

As used herein, the term "oligonucleotide" refers to a series of linked nucleotide residues, which oligonucleotide has a sufficient number of nucleotide bases to be used in a PCR reaction. A short oligonucleotide sequence may be based on, or designed from, a

genomic or cDNA sequence and is used to amplify, confirm, or reveal the presence of an identical, similar or complementary DNA or RNA in a particular cell or tissue.

Oligonucleotides comprise portions of a nucleic acid sequence having about 10 nt, 50 nt, or 100 nt in length, preferably about 15 nt to 30 nt in length. In one embodiment of the invention, an oligonucleotide comprising a nucleic acid molecule less than 100 nt in length would further comprise at least 6 contiguous nucleotides SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, or a complement thereof. Oligonucleotides may be chemically synthesized and may also be used as probes.

In another embodiment, an isolated nucleic acid molecule of the invention comprises a nucleic acid molecule that is a complement of the nucleotide sequence shown in SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, or a portion of this nucleotide sequence (e.g., a fragment that can be used as a probe or primer or a fragment encoding a biologically-active portion of an NOVX polypeptide). A nucleic acid molecule that is complementary to the nucleotide sequence shown SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 is one that is sufficiently complementary to the nucleotide sequence shown SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 that it can hydrogen bond with little or no mismatches to the nucleotide sequence shown SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, thereby forming a stable duplex.

As used herein, the term "complementary" refers to Watson-Crick or Hoogsteen base pairing between nucleotides units of a nucleic acid molecule, and the term "binding" means the physical or chemical interaction between two polypeptides or compounds or associated polypeptides or compounds or combinations thereof. Binding includes ionic, non-ionic, van der Waals, hydrophobic interactions, and the like. A physical interaction can be either direct or indirect. Indirect interactions may be through or due to the effects of another polypeptide or compound. Direct binding refers to interactions that do not take place through, or due to, the effect of another polypeptide or compound, but instead are without other substantial chemical intermediates.

Fragments provided herein are defined as sequences of at least 6 (contiguous) nucleic acids or at least 4 (contiguous) amino acids, a length sufficient to allow for specific hybridization in the case of nucleic acids or for specific recognition of an epitope in the case of amino acids, respectively, and are at most some portion less than a full length sequence. Fragments may be derived from any contiguous portion of a nucleic acid or amino acid sequence of choice. Derivatives are nucleic acid sequences or amino acid sequences formed from the native compounds either directly or by modification or partial substitution. Analogs

are nucleic acid sequences or amino acid sequences that have a structure similar to, but not identical to, the native compound but differs from it in respect to certain components or side chains. Analogs may be synthetic or from a different evolutionary origin and may have a similar or opposite metabolic activity compared to wild type. Homologs are nucleic acid sequences or amino acid sequences of a particular gene that are derived from different species.

Derivatives and analogs may be full length or other than full length, if the derivative or analog contains a modified nucleic acid or amino acid, as described below. Derivatives or analogs of the nucleic acids or proteins of the invention include, but are not limited to, molecules comprising regions that are substantially homologous to the nucleic acids or proteins of the invention, in various embodiments, by at least about 70%, 80%, or 95% identity (with a preferred identity of 80-95%) over a nucleic acid or amino acid sequence of identical size or when compared to an aligned sequence in which the alignment is done by a computer homology program known in the art, or whose encoding nucleic acid is capable of hybridizing to the complement of a sequence encoding the aforementioned proteins under stringent, moderately stringent, or low stringent conditions. *See e.g.* Ausubel, *et al.*, CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, New York, NY, 1993, and below.

A "homologous nucleic acid sequence" or "homologous amino acid sequence," or variations thereof, refer to sequences characterized by a homology at the nucleotide level or amino acid level as discussed above. Homologous nucleotide sequences encode those sequences coding for isoforms of NOVX polypeptides. Isoforms can be expressed in different tissues of the same organism as a result of, for example, alternative splicing of RNA. Alternatively, isoforms can be encoded by different genes. In the invention, homologous nucleotide sequences include nucleotide sequences encoding for an NOVX polypeptide of species other than humans, including, but not limited to: vertebrates, and thus can include, *e.g.*, frog, mouse, rat, rabbit, dog, cat, cow, horse, and other organisms. Homologous nucleotide sequences also include, but are not limited to, naturally occurring allelic variations and mutations of the nucleotide sequences set forth herein. A homologous nucleotide sequence does not, however, include the exact nucleotide sequence encoding human NOVX protein. Homologous nucleic acid sequences include those nucleic acid sequences that encode conservative amino acid substitutions (see below) in SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, as well as a polypeptide possessing NOVX biological activity. Various biological activities of the NOVX proteins are described below.

An NOVX polypeptide is encoded by the open reading frame ("ORF") of an NOVX nucleic acid. An ORF corresponds to a nucleotide sequence that could potentially be translated

into a polypeptide. A stretch of nucleic acids comprising an ORF is uninterrupted by a stop codon. An ORF that represents the coding sequence for a full protein begins with an ATG "start" codon and terminates with one of the three "stop" codons, namely, TAA, TAG, or TGA. For the purposes of this invention, an ORF may be any part of a coding sequence, with  
5 or without a start codon, a stop codon, or both. For an ORF to be considered as a good candidate for coding for a *bona fide* cellular protein, a minimum size requirement is often set, e.g., a stretch of DNA that would encode a protein of 50 amino acids or more.

The nucleotide sequences determined from the cloning of the human NOVX genes allows for the generation of probes and primers designed for use in identifying and/or cloning  
10 NOVX homologues in other cell types, e.g. from other tissues, as well as NOVX homologues from other vertebrates. The probe/primer typically comprises substantially purified oligonucleotide. The oligonucleotide typically comprises a region of nucleotide sequence that hybridizes under stringent conditions to at least about 12, 25, 50, 100, 150, 200, 250, 300, 350 or 400 consecutive sense strand nucleotide sequence SEQ ID NOS:2n-1, wherein n is an  
15 integer between 1 and 162; or an anti-sense strand nucleotide sequence of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162; or of a naturally occurring mutant of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162.

Probes based on the human NOVX nucleotide sequences can be used to detect transcripts or genomic sequences encoding the same or homologous proteins. In various  
20 embodiments, the probe further comprises a label group attached thereto, e.g. the label group can be a radioisotope, a fluorescent compound, an enzyme, or an enzyme co-factor. Such probes can be used as a part of a diagnostic test kit for identifying cells or tissues which mis-express an NOVX protein, such as by measuring a level of an NOVX-encoding nucleic acid in a sample of cells from a subject e.g., detecting NOVX mRNA levels or determining whether a  
25 genomic NOVX gene has been mutated or deleted.

"A polypeptide having a biologically-active portion of an NOVX polypeptide" refers to polypeptides exhibiting activity similar, but not necessarily identical to, an activity of a polypeptide of the invention, including mature forms, as measured in a particular biological assay, with or without dose dependency. A nucleic acid fragment encoding a "biologically-  
30 active portion of NOVX" can be prepared by isolating a portion SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, that encodes a polypeptide having an NOVX biological activity (the biological activities of the NOVX proteins are described below), expressing the encoded portion of NOVX protein (e.g., by recombinant expression *in vitro*) and assessing the activity of the encoded portion of NOVX.

### NOVX Nucleic Acid and Polypeptide Variants

The invention further encompasses nucleic acid molecules that differ from the nucleotide sequences shown in SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 due to degeneracy of the genetic code and thus encode the same NOVX proteins as that encoded by the nucleotide sequences shown in SEQ ID NOS:2n-1, wherein n is an integer  
5 between 1 and 162. In another embodiment, an isolated nucleic acid molecule of the invention has a nucleotide sequence encoding a protein having an amino acid sequence shown in SEQ ID NOS:2n, wherein n is an integer between 1 and 162.

In addition to the human NOVX nucleotide sequences shown in SEQ ID NOS:2n-1,  
10 wherein n is an integer between 1 and 162, it will be appreciated by those skilled in the art that DNA sequence polymorphisms that lead to changes in the amino acid sequences of the NOVX polypeptides may exist within a population (e.g., the human population). Such genetic polymorphism in the NOVX genes may exist among individuals within a population due to natural allelic variation. As used herein, the terms "gene" and "recombinant gene" refer to  
15 nucleic acid molecules comprising an open reading frame (ORF) encoding an NOVX protein, preferably a vertebrate NOVX protein. Such natural allelic variations can typically result in 1-5% variance in the nucleotide sequence of the NOVX genes. Any and all such nucleotide variations and resulting amino acid polymorphisms in the NOVX polypeptides, which are the result of natural allelic variation and that do not alter the functional activity of the NOVX  
20 polypeptides, are intended to be within the scope of the invention.

Moreover, nucleic acid molecules encoding NOVX proteins from other species, and thus that have a nucleotide sequence that differs from the human SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 are intended to be within the scope of the invention. Nucleic acid molecules corresponding to natural allelic variants and homologues of the NOVX  
25 cDNAs of the invention can be isolated based on their homology to the human NOVX nucleic acids disclosed herein using the human cDNAs, or a portion thereof, as a hybridization probe according to standard hybridization techniques under stringent hybridization conditions.

Accordingly, in another embodiment, an isolated nucleic acid molecule of the invention is at least 6 nucleotides in length and hybridizes under stringent conditions to the  
30 nucleic acid molecule comprising the nucleotide sequence of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162. In another embodiment, the nucleic acid is at least 10, 25, 50, 100, 250, 500, 750, 1000, 1500, or 2000 or more nucleotides in length. In yet another embodiment, an isolated nucleic acid molecule of the invention hybridizes to the coding region. As used herein, the term "hybridizes under stringent conditions" is intended to

describe conditions for hybridization and washing under which nucleotide sequences at least 60% homologous to each other typically remain hybridized to each other.

Homologs (*i.e.*, nucleic acids encoding NOVX proteins derived from species other than human) or other related sequences (*e.g.*, paralogs) can be obtained by low, moderate or high stringency hybridization with all or a portion of the particular human sequence as a probe using methods well known in the art for nucleic acid hybridization and cloning.

As used herein, the phrase "stringent hybridization conditions" refers to conditions under which a probe, primer or oligonucleotide will hybridize to its target sequence, but to no other sequences. Stringent conditions are sequence-dependent and will be different in different circumstances. Longer sequences hybridize specifically at higher temperatures than shorter sequences. Generally, stringent conditions are selected to be about 5 °C lower than the thermal melting point ( $T_m$ ) for the specific sequence at a defined ionic strength and pH. The  $T_m$  is the temperature (under defined ionic strength, pH and nucleic acid concentration) at which 50% of the probes complementary to the target sequence hybridize to the target sequence at equilibrium. Since the target sequences are generally present at excess, at  $T_m$ , 50% of the probes are occupied at equilibrium. Typically, stringent conditions will be those in which the salt concentration is less than about 1.0 M sodium ion, typically about 0.01 to 1.0 M sodium ion (or other salts) at pH 7.0 to 8.3 and the temperature is at least about 30°C for short probes, primers or oligonucleotides (*e.g.*, 10 nt to 50 nt) and at least about 60°C for longer probes, primers and oligonucleotides. Stringent conditions may also be achieved with the addition of destabilizing agents, such as formamide.

Stringent conditions are known to those skilled in the art and can be found in Ausubel, *et al.*, (eds.), CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, N.Y. (1989), 6.3.1-6.3.6. Preferably, the conditions are such that sequences at least about 65%, 70%, 75%, 85%, 90%, 95%, 98%, or 99% homologous to each other typically remain hybridized to each other. A non-limiting example of stringent hybridization conditions are hybridization in a high salt buffer comprising 6X SSC, 50 mM Tris-HCl (pH 7.5), 1 mM EDTA, 0.02% PVP, 0.02% Ficoll, 0.02% BSA, and 500 mg/ml denatured salmon sperm DNA at 65°C, followed by one or more washes in 0.2X SSC, 0.01% BSA at 50°C. An isolated nucleic acid molecule of the invention that hybridizes under stringent conditions to the sequences SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, corresponds to a naturally-occurring nucleic acid molecule. As used herein, a "naturally-occurring" nucleic

acid molecule refers to an RNA or DNA molecule having a nucleotide sequence that occurs in nature (*e.g.*, encodes a natural protein).

In a second embodiment, a nucleic acid sequence that is hybridizable to the nucleic acid molecule comprising the nucleotide sequence of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, or fragments, analogs or derivatives thereof, under conditions of moderate stringency is provided. A non-limiting example of moderate stringency hybridization conditions are hybridization in 6X SSC, 5X Denhardt's solution, 0.5% SDS and 100 mg/ml denatured salmon sperm DNA at 55°C, followed by one or more washes in 1X SSC, 0.1% SDS at 37°C. Other conditions of moderate stringency that may be used are well-known within the art. *See, e.g.*, Ausubel, *et al.* (eds.), 1993, CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, NY, and Kriegler, 1990; GENE TRANSFER AND EXPRESSION, A LABORATORY MANUAL, Stockton Press, NY.

In a third embodiment, a nucleic acid that is hybridizable to the nucleic acid molecule comprising the nucleotide sequences SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, or fragments, analogs or derivatives thereof, under conditions of low stringency, is provided. A non-limiting example of low stringency hybridization conditions are hybridization in 35% formamide, 5X SSC, 50 mM Tris-HCl (pH 7.5), 5 mM EDTA, 0.02% PVP, 0.02% Ficoll, 0.2% BSA, 100 mg/ml denatured salmon sperm DNA, 10% (wt/vol) dextran sulfate at 40°C, followed by one or more washes in 2X SSC, 25 mM Tris-HCl (pH 7.4), 5 mM EDTA, and 0.1% SDS at 50°C. Other conditions of low stringency that may be used are well known in the art (*e.g.*, as employed for cross-species hybridizations). *See, e.g.*, Ausubel, *et al.* (eds.), 1993, CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, NY, and Kriegler, 1990, GENE TRANSFER AND EXPRESSION, A LABORATORY MANUAL, Stockton Press, NY; Shilo and Weinberg, 1981. *Proc Natl Acad Sci USA* 78: 6789-6792.

### Conservative Mutations

In addition to naturally-occurring allelic variants of NOVX sequences that may exist in the population, the skilled artisan will further appreciate that changes can be introduced by mutation into the nucleotide sequences SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, thereby leading to changes in the amino acid sequences of the encoded NOVX proteins, without altering the functional ability of said NOVX proteins. For example, nucleotide substitutions leading to amino acid substitutions at "non-essential" amino acid residues can be made in the sequence SEQ ID NOS:2n, wherein n is an integer between 1 and 162. A "non-essential" amino acid residue is a residue that can be altered from the wild-type

sequences of the NOVX proteins without altering their biological activity, whereas an "essential" amino acid residue is required for such biological activity. For example, amino acid residues that are conserved among the NOVX proteins of the invention are predicted to be particularly non-amenable to alteration. Amino acids for which conservative substitutions can be made are well-known within the art.

Another aspect of the invention pertains to nucleic acid molecules encoding NOVX proteins that contain changes in amino acid residues that are not essential for activity. Such NOVX proteins differ in amino acid sequence from SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 yet retain biological activity. In one embodiment, the isolated nucleic acid molecule comprises a nucleotide sequence encoding a protein, wherein the protein comprises an amino acid sequence at least about 45% homologous to the amino acid sequences SEQ ID NOS:2n, wherein n is an integer between 1 and 162. Preferably, the protein encoded by the nucleic acid molecule is at least about 60% homologous to SEQ ID NOS:2n, wherein n is an integer between 1 and 162; more preferably at least about 70% homologous SEQ ID NOS:2n, wherein n is an integer between 1 and 162; still more preferably at least about 80% homologous to SEQ ID NOS:2n, wherein n is an integer between 1 and 162; even more preferably at least about 90% homologous to SEQ ID NOS:2n, wherein n is an integer between 1 and 162; and most preferably at least about 95% homologous to SEQ ID NOS:2n, wherein n is an integer between 1 and 162.

An isolated nucleic acid molecule encoding an NOVX protein homologous to the protein of SEQ ID NOS:2n, wherein n is an integer between 1 and 162 can be created by introducing one or more nucleotide substitutions, additions or deletions into the nucleotide sequence of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, such that one or more amino acid substitutions, additions or deletions are introduced into the encoded protein.

Mutations can be introduced into SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 by standard techniques, such as site-directed mutagenesis and PCR-mediated mutagenesis. Preferably, conservative amino acid substitutions are made at one or more predicted, non-essential amino acid residues. A "conservative amino acid substitution" is one in which the amino acid residue is replaced with an amino acid residue having a similar side chain. Families of amino acid residues having similar side chains have been defined within the art. These families include amino acids with basic side chains (e.g., lysine, arginine, histidine), acidic side chains (e.g., aspartic acid, glutamic acid), uncharged polar side chains (e.g., glycine, asparagine, glutamine, serine, threonine, tyrosine, cysteine), nonpolar side chains (e.g., alanine, valine, leucine, isoleucine, proline, phenylalanine, methionine,

tryptophan), beta-branched side chains (e.g., threonine, valine, isoleucine) and aromatic side chains (e.g., tyrosine, phenylalanine, tryptophan, histidine). Thus, a predicted non-essential amino acid residue in the NOVX protein is replaced with another amino acid residue from the same side chain family. Alternatively, in another embodiment, mutations can be introduced randomly along all or part of an NOVX coding sequence, such as by saturation mutagenesis, and the resultant mutants can be screened for NOVX biological activity to identify mutants that retain activity. Following mutagenesis SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, the encoded protein can be expressed by any recombinant technology known in the art and the activity of the protein can be determined.

The relatedness of amino acid families may also be determined based on side chain interactions. Substituted amino acids may be fully conserved "strong" residues or fully conserved "weak" residues. The "strong" group of conserved amino acid residues may be any one of the following groups: STA, NEQK, NHQK, NDEQ, QHRK, MILV, MILF, HY, FYW, wherein the single letter amino acid codes are grouped by those amino acids that may be substituted for each other. Likewise, the "weak" group of conserved residues may be any one of the following: CSA, ATV, SAG, STNK, STPA, SGND, SNDEQK, NDEQHK, NEQHRK, VLIM, HFY, wherein the letters within each group represent the single letter amino acid code.

In one embodiment, a mutant NOVX protein can be assayed for (i) the ability to form protein:protein interactions with other NOVX proteins, other cell-surface proteins, or biologically-active portions thereof, (ii) complex formation between a mutant NOVX protein and an NOVX ligand; or (iii) the ability of a mutant NOVX protein to bind to an intracellular target protein or biologically-active portion thereof; (e.g. avidin proteins).

In yet another embodiment, a mutant NOVX protein can be assayed for the ability to regulate a specific biological function (e.g., regulation of insulin release).

#### **Antisense Nucleic Acids**

Another aspect of the invention pertains to isolated antisense nucleic acid molecules that are hybridizable to or complementary to the nucleic acid molecule comprising the nucleotide sequence of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, or fragments, analogs or derivatives thereof. An "antisense" nucleic acid comprises a nucleotide sequence that is complementary to a "sense" nucleic acid encoding a protein (e.g., complementary to the coding strand of a double-stranded cDNA molecule or complementary to an mRNA sequence). In specific aspects, antisense nucleic acid molecules are provided that comprise a sequence complementary to at least about 10, 25, 50, 100, 250 or 500 nucleotides

or an entire NOVX coding strand, or to only a portion thereof. Nucleic acid molecules encoding fragments, homologs, derivatives and analogs of an NOVX protein of SEQ ID NOS:2n, wherein n is an integer between 1 and 162, or antisense nucleic acids complementary to an NOVX nucleic acid sequence of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, are additionally provided.

In one embodiment, an antisense nucleic acid molecule is antisense to a "coding region" of the coding strand of a nucleotide sequence encoding an NOVX protein. The term "coding region" refers to the region of the nucleotide sequence comprising codons which are translated into amino acid residues. In another embodiment, the antisense nucleic acid molecule is antisense to a "noncoding region" of the coding strand of a nucleotide sequence encoding the NOVX protein. The term "noncoding region" refers to 5' and 3' sequences which flank the coding region that are not translated into amino acids (*i.e.*, also referred to as 5' and 3' untranslated regions).

Given the coding strand sequences encoding the NOVX protein disclosed herein, antisense nucleic acids of the invention can be designed according to the rules of Watson and Crick or Hoogsteen base pairing. The antisense nucleic acid molecule can be complementary to the entire coding region of NOVX mRNA, but more preferably is an oligonucleotide that is antisense to only a portion of the coding or noncoding region of NOVX mRNA. For example, the antisense oligonucleotide can be complementary to the region surrounding the translation start site of NOVX mRNA. An antisense oligonucleotide can be, for example, about 5, 10, 15, 20, 25, 30, 35, 40, 45 or 50 nucleotides in length. An antisense nucleic acid of the invention can be constructed using chemical synthesis or enzymatic ligation reactions using procedures known in the art. For example, an antisense nucleic acid (*e.g.*, an antisense oligonucleotide) can be chemically synthesized using naturally-occurring nucleotides or variously modified nucleotides designed to increase the biological stability of the molecules or to increase the physical stability of the duplex formed between the antisense and sense nucleic acids (*e.g.*, phosphorothioate derivatives and acridine substituted nucleotides can be used).

Examples of modified nucleotides that can be used to generate the antisense nucleic acid include: 5-fluorouracil, 5-bromouracil, 5-chlorouracil, 5-iodouracil, hypoxanthine, xanthine, 4-acetylcytosine, 5-(carboxyhydroxymethyl) uracil, 5-carboxymethylaminomethyl-2-thiouridine, 5-carboxymethylaminomethyluracil, dihydrouracil, beta-D-galactosylqueosine, inosine, N6-isopentenyladenine, 1-methylguanine, 1-methylinosine, 2,2-dimethylguanine, 2-methyladenine, 2-methylguanine, 3-methylcytosine, 5-methylcytosine, N6-adenine, 7-methylguanine, 5-methylaminomethyluracil, 5-methoxyaminomethyl-2-thiouracil,

beta-D-mannosylqueosine, 5'-methoxycarboxymethyluracil, 5-methoxyuracil, 2-methylthio-N6-isopentenyladenine, uracil-5-oxyacetic acid (v), wybutoxosine, pseudouracil, queosine, 2-thiocytosine, 5-methyl-2-thiouracil, 2-thiouracil, 4-thiouracil, 5-methyluracil, uracil-5-oxyacetic acid methylester, uracil-5-oxyacetic acid (v), 5-methyl-2-thiouracil, 3-(3-amino-3-N-2-carboxypropyl) uracil, (acp3)w, and 2,6-diaminopurine. Alternatively, the antisense nucleic acid can be produced biologically using an expression vector into which a nucleic acid has been subcloned in an antisense orientation (*i.e.*, RNA transcribed from the inserted nucleic acid will be of an antisense orientation to a target nucleic acid of interest, described further in the following subsection).

The antisense nucleic acid molecules of the invention are typically administered to a subject or generated *in situ* such that they hybridize with or bind to cellular mRNA and/or genomic DNA encoding an NOVX protein to thereby inhibit expression of the protein (*e.g.*, by inhibiting transcription and/or translation). The hybridization can be by conventional nucleotide complementarity to form a stable duplex, or, for example, in the case of an antisense nucleic acid molecule that binds to DNA duplexes, through specific interactions in the major groove of the double helix. An example of a route of administration of antisense nucleic acid molecules of the invention includes direct injection at a tissue site. Alternatively, antisense nucleic acid molecules can be modified to target selected cells and then administered systemically. For example, for systemic administration, antisense molecules can be modified such that they specifically bind to receptors or antigens expressed on a selected cell surface (*e.g.*, by linking the antisense nucleic acid molecules to peptides or antibodies that bind to cell surface receptors or antigens). The antisense nucleic acid molecules can also be delivered to cells using the vectors described herein. To achieve sufficient nucleic acid molecules, vector constructs in which the antisense nucleic acid molecule is placed under the control of a strong pol II or pol III promoter are preferred.

In yet another embodiment, the antisense nucleic acid molecule of the invention is an  $\alpha$ -anomeric nucleic acid molecule. An  $\alpha$ -anomeric nucleic acid molecule forms specific double-stranded hybrids with complementary RNA in which, contrary to the usual  $\beta$ -units, the strands run parallel to each other. *See, e.g.*, Gaultier, *et al.*, 1987. *Nucl. Acids Res.* 15: 6625-6641. The antisense nucleic acid molecule can also comprise a 2'-o-methylribonucleotide (*See, e.g.*, Inoue, *et al.* 1987. *Nucl. Acids Res.* 15: 6131-6148) or a chimeric RNA-DNA analogue (*See, e.g.*, Inoue, *et al.*, 1987. *FEBS Lett.* 215: 327-330).

### Ribozymes and PNA Moieties

Nucleic acid modifications include, by way of non-limiting example, modified bases, and nucleic acids whose sugar phosphate backbones are modified or derivatized. These modifications are carried out at least in part to enhance the chemical stability of the modified  
5 nucleic acid, such that they may be used, for example, as antisense binding nucleic acids in therapeutic applications in a subject.

In one embodiment, an antisense nucleic acid of the invention is a ribozyme. Ribozymes are catalytic RNA molecules with ribonuclease activity that are capable of cleaving a single-stranded nucleic acid, such as an mRNA, to which they have a  
10 complementary region. Thus, ribozymes (*e.g.*, hammerhead ribozymes as described in Haselhoff and Gerlach 1988. *Nature* 334: 585-591) can be used to catalytically cleave NOVX mRNA transcripts to thereby inhibit translation of NOVX mRNA. A ribozyme having specificity for an NOVX-encoding nucleic acid can be designed based upon the nucleotide sequence of an NOVX cDNA disclosed herein (*i.e.*, SEQ ID NOS:2n-1, wherein n is an  
15 integer between 1 and 162). For example, a derivative of a *Tetrahymena* L-19 IVS RNA can be constructed in which the nucleotide sequence of the active site is complementary to the nucleotide sequence to be cleaved in an NOVX-encoding mRNA. *See, e.g.*, U.S. Patent 4,987,071 to Cech, *et al.* and U.S. Patent 5,116,742 to Cech, *et al.* NOVX mRNA can also be used to select a catalytic RNA having a specific ribonuclease activity from a pool of RNA  
20 molecules. *See, e.g.*, Bartel *et al.*, (1993) *Science* 261:1411-1418.

Alternatively, NOVX gene expression can be inhibited by targeting nucleotide sequences complementary to the regulatory region of the NOVX nucleic acid (*e.g.*, the NOVX promoter and/or enhancers) to form triple helical structures that prevent transcription of the NOVX gene in target cells. *See, e.g.*, Helene, 1991. *Anticancer Drug Des.* 6: 569-84; Helene,  
25 *et al.* 1992. *Ann. N.Y. Acad. Sci.* 660: 27-36; Maher, 1992. *Bioassays* 14: 807-15.

In various embodiments, the NOVX nucleic acids can be modified at the base moiety, sugar moiety or phosphate backbone to improve, *e.g.*, the stability, hybridization, or solubility of the molecule. For example, the deoxyribose phosphate backbone of the nucleic acids can be modified to generate peptide nucleic acids. *See, e.g.*, Hyrup, *et al.*, 1996. *Bioorg Med*  
30 *Chem* 4: 5-23. As used herein, the terms "peptide nucleic acids" or "PNAs" refer to nucleic acid mimics (*e.g.*, DNA mimics) in which the deoxyribose phosphate backbone is replaced by a pseudopeptide backbone and only the four natural nucleobases are retained. The neutral backbone of PNAs has been shown to allow for specific hybridization to DNA and RNA under conditions of low ionic strength. The synthesis of PNA oligomers can be performed using

standard solid phase peptide synthesis protocols as described in Hyrup, *et al.*, 1996. *supra*; Perry-O'Keefe, *et al.*, 1996. *Proc. Natl. Acad. Sci. USA* 93: 14670-14675.

PNAs of NOVX can be used in therapeutic and diagnostic applications. For example, PNAs can be used as antisense or antigene agents for sequence-specific modulation of gene expression by, *e.g.*, inducing transcription or translation arrest or inhibiting replication. PNAs of NOVX can also be used, for example, in the analysis of single base pair mutations in a gene (*e.g.*, PNA directed PCR clamping; as artificial restriction enzymes when used in combination with other enzymes, *e.g.*, S<sub>1</sub> nucleases (*See*, Hyrup, *et al.*, 1996. *supra*); or as probes or primers for DNA sequence and hybridization (*See*, Hyrup, *et al.*, 1996, *supra*; Perry-O'Keefe, *et al.*, 1996. *supra*).

In another embodiment, PNAs of NOVX can be modified, *e.g.*, to enhance their stability or cellular uptake, by attaching lipophilic or other helper groups to PNA, by the formation of PNA-DNA chimeras, or by the use of liposomes or other techniques of drug delivery known in the art. For example, PNA-DNA chimeras of NOVX can be generated that may combine the advantageous properties of PNA and DNA. Such chimeras allow DNA recognition enzymes (*e.g.*, Cleavage signal-1 protein H and DNA polymerases) to interact with the DNA portion while the PNA portion would provide high binding affinity and specificity. PNA-DNA chimeras can be linked using linkers of appropriate lengths selected in terms of base stacking, number of bonds between the nucleobases, and orientation (*see*, Hyrup, *et al.*, 1996. *supra*). The synthesis of PNA-DNA chimeras can be performed as described in Hyrup, *et al.*, 1996. *supra* and Finn, *et al.*, 1996. *Nucl Acids Res* 24: 3357-3363. For example, a DNA chain can be synthesized on a solid support using standard phosphoramidite coupling chemistry, and modified nucleoside analogs, *e.g.*, 5'-(4-methoxytrityl)amino-5'-deoxy-thymidine phosphoramidite, can be used between the PNA and the 5' end of DNA. *See, e.g.*, Mag, *et al.*, 1989. *Nucl Acid Res* 17: 5973-5988. PNA monomers are then coupled in a stepwise manner to produce a chimeric molecule with a 5' PNA segment and a 3' DNA segment. *See, e.g.*, Finn, *et al.*, 1996. *supra*. Alternatively, chimeric molecules can be synthesized with a 5' DNA segment and a 3' PNA segment. *See, e.g.*, Petersen, *et al.*, 1975. *Bioorg. Med. Chem. Lett.* 5: 1119-11124.

In other embodiments, the oligonucleotide may include other appended groups such as peptides (*e.g.*, for targeting host cell receptors *in vivo*), or agents facilitating transport across the cell membrane (*see, e.g.*, Letsinger, *et al.*, 1989. *Proc. Natl. Acad. Sci. U.S.A.* 86: 6553-6556; Lemaitre, *et al.*, 1987. *Proc. Natl. Acad. Sci.* 84: 648-652; PCT Publication No. WO88/09810) or the blood-brain barrier (*see, e.g.*, PCT Publication No. WO 89/10134). In

addition, oligonucleotides can be modified with hybridization triggered cleavage agents (*see, e.g., Krol, et al., 1988. BioTechniques 6:958-976*) or intercalating agents (*see, e.g., Zon, 1988. Pharm. Res. 5: 539-549*). To this end, the oligonucleotide may be conjugated to another molecule, *e.g., a peptide, a hybridization triggered cross-linking agent, a transport agent, a*  
5 *hybridization-triggered cleavage agent, and the like.*

### NOVX Polypeptides

A polypeptide according to the invention includes a polypeptide including the amino acid sequence of NOVX polypeptides whose sequences are provided in SEQ ID NOS:2n, wherein n is an integer between 1 and 162. The invention also includes a mutant or variant  
10 protein any of whose residues may be changed from the corresponding residues shown in SEQ ID NOS:2n, wherein n is an integer between 1 and 162 while still encoding a protein that maintains its NOVX activities and physiological functions, or a functional fragment thereof.

In general, an NOVX variant that preserves NOVX-like function includes any variant in which residues at a particular position in the sequence have been substituted by other amino  
15 acids, and further include the possibility of inserting an additional residue or residues between two residues of the parent protein as well as the possibility of deleting one or more residues from the parent sequence. Any amino acid substitution, insertion, or deletion is encompassed by the invention. In favorable circumstances, the substitution is a conservative substitution as defined above.

One aspect of the invention pertains to isolated NOVX proteins, and biologically-active portions thereof, or derivatives, fragments, analogs or homologs thereof. Also provided are polypeptide fragments suitable for use as immunogens to raise anti-NOVX antibodies. In one embodiment, native NOVX proteins can be isolated from cells or tissue sources by an appropriate purification scheme using standard protein purification techniques. In another  
20 embodiment, NOVX proteins are produced by recombinant DNA techniques. Alternative to recombinant expression, an NOVX protein or polypeptide can be synthesized chemically using standard peptide synthesis techniques.  
25

An "isolated" or "purified" polypeptide or protein or biologically-active portion thereof is substantially free of cellular material or other contaminating proteins from the cell or tissue  
30 source from which the NOVX protein is derived, or substantially free from chemical precursors or other chemicals when chemically synthesized. The language "substantially free of cellular material" includes preparations of NOVX proteins in which the protein is separated from cellular components of the cells from which it is isolated or recombinantly-produced. In

one embodiment, the language "substantially free of cellular material" includes preparations of NOVX proteins having less than about 30% (by dry weight) of non-NOVX proteins (also referred to herein as a "contaminating protein"), more preferably less than about 20% of non-NOVX proteins, still more preferably less than about 10% of non-NOVX proteins, and most preferably less than about 5% of non-NOVX proteins. When the NOVX protein or biologically-active portion thereof is recombinantly-produced, it is also preferably substantially free of culture medium, *i.e.*, culture medium represents less than about 20%, more preferably less than about 10%, and most preferably less than about 5% of the volume of the NOVX protein preparation.

The language "substantially free of chemical precursors or other chemicals" includes preparations of NOVX proteins in which the protein is separated from chemical precursors or other chemicals that are involved in the synthesis of the protein. In one embodiment, the language "substantially free of chemical precursors or other chemicals" includes preparations of NOVX proteins having less than about 30% (by dry weight) of chemical precursors or non-NOVX chemicals, more preferably less than about 20% chemical precursors or non-NOVX chemicals, still more preferably less than about 10% chemical precursors or non-NOVX chemicals, and most preferably less than about 5% chemical precursors or non-NOVX chemicals.

Biologically-active portions of NOVX proteins include peptides comprising amino acid sequences sufficiently homologous to or derived from the amino acid sequences of the NOVX proteins (*e.g.*, the amino acid sequence shown in SEQ ID NOS:2n, wherein n is an integer between 1 and 162) that include fewer amino acids than the full-length NOVX proteins, and exhibit at least one activity of an NOVX protein. Typically, biologically-active portions comprise a domain or motif with at least one activity of the NOVX protein. A biologically-active portion of an NOVX protein can be a polypeptide which is, for example, 10, 25, 50, 100 or more amino acid residues in length.

Moreover, other biologically-active portions, in which other regions of the protein are deleted, can be prepared by recombinant techniques and evaluated for one or more of the functional activities of a native NOVX protein.

In an embodiment, the NOVX protein has an amino acid sequence shown SEQ ID NOS:2n, wherein n is an integer between 1 and 162. In other embodiments, the NOVX protein is substantially homologous to SEQ ID NOS:2n, wherein n is an integer between 1 and 162, and retains the functional activity of the protein of SEQ ID NOS:2n, wherein n is an integer between 1 and 162, yet differs in amino acid sequence due to natural allelic variation

or mutagenesis, as described in detail, below. Accordingly, in another embodiment, the NOVX protein is a protein that comprises an amino acid sequence at least about 45% homologous to the amino acid sequence SEQ ID NOS:2n, wherein n is an integer between 1 and 162, and retains the functional activity of the NOVX proteins of SEQ ID NOS:2n, wherein  
5 n is an integer between 1 and 162.

### Determining Homology Between Two or More Sequences

To determine the percent homology of two amino acid sequences or of two nucleic acids, the sequences are aligned for optimal comparison purposes (*e.g.*, gaps can be introduced  
10 in the sequence of a first amino acid or nucleic acid sequence for optimal alignment with a second amino or nucleic acid sequence). The amino acid residues or nucleotides at corresponding amino acid positions or nucleotide positions are then compared. When a position in the first sequence is occupied by the same amino acid residue or nucleotide as the corresponding position in the second sequence, then the molecules are homologous at that  
15 position (*i.e.*, as used herein amino acid or nucleic acid "homology" is equivalent to amino acid or nucleic acid "identity").

The nucleic acid sequence homology may be determined as the degree of identity between two sequences. The homology may be determined using computer programs known in the art, such as GAP software provided in the GCG program package. *See*, Needleman and  
20 Wunsch, 1970. *J Mol Biol* 48: 443-453. Using GCG GAP software with the following settings for nucleic acid sequence comparison: GAP creation penalty of 5.0 and GAP extension penalty of 0.3, the coding region of the analogous nucleic acid sequences referred to above exhibits a degree of identity preferably of at least 70%, 75%, 80%, 85%, 90%, 95%, 98%, or 99%, with the CDS (encoding) part of the DNA sequence shown in SEQ ID NOS:2n-1,  
25 wherein n is an integer between 1 and 162.

The term "sequence identity" refers to the degree to which two polynucleotide or polypeptide sequences are identical on a residue-by-residue basis over a particular region of comparison. The term "percentage of sequence identity" is calculated by comparing two optimally aligned sequences over that region of comparison, determining the number of  
30 positions at which the identical nucleic acid base (*e.g.*, A, T, C, G, U, or I, in the case of nucleic acids) occurs in both sequences to yield the number of matched positions, dividing the number of matched positions by the total number of positions in the region of comparison (*i.e.*, the window size), and multiplying the result by 100 to yield the percentage of sequence identity. The term "substantial identity" as used herein denotes a characteristic of a

polynucleotide sequence, wherein the polynucleotide comprises a sequence that has at least 80 percent sequence identity, preferably at least 85 percent identity and often 90 to 95 percent sequence identity, more usually at least 99 percent sequence identity as compared to a reference sequence over a comparison region.

5

### Chimeric and Fusion Proteins

The invention also provides NOVX chimeric or fusion proteins. As used herein, an NOVX "chimeric protein" or "fusion protein" comprises an NOVX polypeptide operatively-linked to a non-NOVX polypeptide. An "NOVX polypeptide" refers to a polypeptide having  
10 an amino acid sequence corresponding to an NOVX protein SEQ ID NOS:2n, wherein n is an integer between 1 and 162, whereas a "non-NOVX polypeptide" refers to a polypeptide having an amino acid sequence corresponding to a protein that is not substantially homologous to the NOVX protein, *e.g.*, a protein that is different from the NOVX protein and that is derived from the same or a different organism. Within an NOVX fusion protein the NOVX polypeptide can  
15 correspond to all or a portion of an NOVX protein. In one embodiment, an NOVX fusion protein comprises at least one biologically-active portion of an NOVX protein. In another embodiment, an NOVX fusion protein comprises at least two biologically-active portions of an NOVX protein. In yet another embodiment, an NOVX fusion protein comprises at least three biologically-active portions of an NOVX protein. Within the fusion protein, the term  
20 "operatively-linked" is intended to indicate that the NOVX polypeptide and the non-NOVX polypeptide are fused in-frame with one another. The non-NOVX polypeptide can be fused to the N-terminus or C-terminus of the NOVX polypeptide.

In one embodiment, the fusion protein is a GST-NOVX fusion protein in which the NOVX sequences are fused to the C-terminus of the GST (glutathione S-transferase)  
25 sequences. Such fusion proteins can facilitate the purification of recombinant NOVX polypeptides.

In another embodiment, the fusion protein is an NOVX protein containing a heterologous signal sequence at its N-terminus. In certain host cells (*e.g.*, mammalian host cells), expression and/or secretion of NOVX can be increased through use of a heterologous  
30 signal sequence.

In yet another embodiment, the fusion protein is an NOVX-immunoglobulin fusion protein in which the NOVX sequences are fused to sequences derived from a member of the immunoglobulin protein family. The NOVX-immunoglobulin fusion proteins of the invention can be incorporated into pharmaceutical compositions and administered to a subject to inhibit

an interaction between an NOVX ligand and an NOVX protein on the surface of a cell, to thereby suppress NOVX-mediated signal transduction *in vivo*. The NOVX-immunoglobulin fusion proteins can be used to affect the bioavailability of an NOVX cognate ligand.

Inhibition of the NOVX ligand/NOVX interaction may be useful therapeutically for both the treatment of proliferative and differentiative disorders, as well as modulating (*e.g.* promoting or inhibiting) cell survival. Moreover, the NOVX-immunoglobulin fusion proteins of the invention can be used as immunogens to produce anti-NOVX antibodies in a subject, to purify NOVX ligands, and in screening assays to identify molecules that inhibit the interaction of NOVX with an NOVX ligand.

An NOVX chimeric or fusion protein of the invention can be produced by standard recombinant DNA techniques. For example, DNA fragments coding for the different polypeptide sequences are ligated together in-frame in accordance with conventional techniques, *e.g.*, by employing blunt-ended or stagger-ended termini for ligation, restriction enzyme digestion to provide for appropriate termini, filling-in of cohesive ends as appropriate, alkaline phosphatase treatment to avoid undesirable joining, and enzymatic ligation. In another embodiment, the fusion gene can be synthesized by conventional techniques including automated DNA synthesizers. Alternatively, PCR amplification of gene fragments can be carried out using anchor primers that give rise to complementary overhangs between two consecutive gene fragments that can subsequently be annealed and reamplified to generate a chimeric gene sequence (*see, e.g.*, Ausubel, *et al.* (eds.) CURRENT PROTOCOLS IN MOLECULAR BIOLOGY, John Wiley & Sons, 1992). Moreover, many expression vectors are commercially available that already encode a fusion moiety (*e.g.*, a GST polypeptide). An NOVX-encoding nucleic acid can be cloned into such an expression vector such that the fusion moiety is linked in-frame to the NOVX protein.

#### NOVX Agonists and Antagonists

The invention also pertains to variants of the NOVX proteins that function as either NOVX agonists (*i.e.*, mimetics) or as NOVX antagonists. Variants of the NOVX protein can be generated by mutagenesis (*e.g.*, discrete point mutation or truncation of the NOVX protein).

An agonist of the NOVX protein can retain substantially the same, or a subset of, the biological activities of the naturally occurring form of the NOVX protein. An antagonist of the NOVX protein can inhibit one or more of the activities of the naturally occurring form of the NOVX protein by, for example, competitively binding to a downstream or upstream member of a cellular signaling cascade which includes the NOVX protein. Thus, specific

biological effects can be elicited by treatment with a variant of limited function. In one embodiment, treatment of a subject with a variant having a subset of the biological activities of the naturally occurring form of the protein has fewer side effects in a subject relative to treatment with the naturally occurring form of the NOVX proteins.

5 Variants of the NOVX proteins that function as either NOVX agonists (*i.e.*, mimetics) or as NOVX antagonists can be identified by screening combinatorial libraries of mutants (*e.g.*, truncation mutants) of the NOVX proteins for NOVX protein agonist or antagonist activity. In one embodiment, a variegated library of NOVX variants is generated by combinatorial mutagenesis at the nucleic acid level and is encoded by a variegated gene  
10 library. A variegated library of NOVX variants can be produced by, for example, enzymatically ligating a mixture of synthetic oligonucleotides into gene sequences such that a degenerate set of potential NOVX sequences is expressible as individual polypeptides, or alternatively, as a set of larger fusion proteins (*e.g.*, for phage display) containing the set of NOVX sequences therein. There are a variety of methods which can be used to produce  
15 libraries of potential NOVX variants from a degenerate oligonucleotide sequence. Chemical synthesis of a degenerate gene sequence can be performed in an automatic DNA synthesizer, and the synthetic gene then ligated into an appropriate expression vector. Use of a degenerate set of genes allows for the provision, in one mixture, of all of the sequences encoding the desired set of potential NOVX sequences. Methods for synthesizing degenerate  
20 oligonucleotides are well-known within the art. *See, e.g.*, Narang, 1983. *Tetrahedron* 39: 3; Itakura, *et al.*, 1984. *Annu. Rev. Biochem.* 53: 323; Itakura, *et al.*, 1984. *Science* 198: 1056; Ike, *et al.*, 1983. *Nucl. Acids Res.* 11: 477.

### Polypeptide Libraries

25 In addition, libraries of fragments of the NOVX protein coding sequences can be used to generate a variegated population of NOVX fragments for screening and subsequent selection of variants of an NOVX protein. In one embodiment, a library of coding sequence fragments can be generated by treating a double stranded PCR fragment of an NOVX coding sequence with a nuclease under conditions wherein nicking occurs only about once per  
30 molecule, denaturing the double stranded DNA, renaturing the DNA to form double-stranded DNA that can include sense/antisense pairs from different nicked products, removing single stranded portions from reformed duplexes by treatment with S<sub>1</sub> nuclease, and ligating the resulting fragment library into an expression vector. By this method, expression libraries can

be derived which encodes N-terminal and internal fragments of various sizes of the NOVX proteins.

Various techniques are known in the art for screening gene products of combinatorial libraries made by point mutations or truncation, and for screening cDNA libraries for gene products having a selected property. Such techniques are adaptable for rapid screening of the gene libraries generated by the combinatorial mutagenesis of NOVX proteins. The most widely used techniques, which are amenable to high throughput analysis, for screening large gene libraries typically include cloning the gene library into replicable expression vectors, transforming appropriate cells with the resulting library of vectors, and expressing the combinatorial genes under conditions in which detection of a desired activity facilitates isolation of the vector encoding the gene whose product was detected. Recursive ensemble mutagenesis (REM), a new technique that enhances the frequency of functional mutants in the libraries, can be used in combination with the screening assays to identify NOVX variants. See, e.g., Arkin and Yourvan, 1992. *Proc. Natl. Acad. Sci. USA* 89: 7811-7815; Delgrave, et al., 1993. *Protein Engineering* 6:327-331.

#### NOVX Antibodies

The term "antibody" as used herein refers to immunoglobulin molecules and immunologically active portions of immunoglobulin (Ig) molecules, i.e., molecules that contain an antigen binding site that specifically binds (immunoreacts with) an antigen. Such antibodies include, but are not limited to, polyclonal, monoclonal, chimeric, single chain,  $F_{ab}$ ,  $F_{ab}'$  and  $F_{(ab)2}$  fragments, and an  $F_{ab}$  expression library. In general, antibody molecules obtained from humans relates to any of the classes IgG, IgM, IgA, IgE and IgD, which differ from one another by the nature of the heavy chain present in the molecule. Certain classes have subclasses as well, such as IgG<sub>1</sub>, IgG<sub>2</sub>, and others. Furthermore, in humans, the light chain may be a kappa chain or a lambda chain. Reference herein to antibodies includes a reference to all such classes, subclasses and types of human antibody species.

An isolated protein of the invention intended to serve as an antigen, or a portion or fragment thereof, can be used as an immunogen to generate antibodies that immunospecifically bind the antigen, using standard techniques for polyclonal and monoclonal antibody preparation. The full-length protein can be used or, alternatively, the invention provides antigenic peptide fragments of the antigen for use as immunogens. An antigenic peptide fragment comprises at least 6 amino acid residues of the amino acid sequence of the full length protein, such as an amino acid sequence shown in SEQ ID NOs: 2n, wherein n is an

integer between 1 and 162, and encompasses an epitope thereof such that an antibody raised against the peptide forms a specific immune complex with the full length protein or with any fragment that contains the epitope. Preferably, the antigenic peptide comprises at least 10 amino acid residues, or at least 15 amino acid residues, or at least 20 amino acid residues, or at  
5 least 30 amino acid residues. Preferred epitopes encompassed by the antigenic peptide are regions of the protein that are located on its surface; commonly these are hydrophilic regions.

In certain embodiments of the invention, at least one epitope encompassed by the antigenic peptide is a region of NOVX that is located on the surface of the protein, *e.g.*, a hydrophilic region. A hydrophobicity analysis of the human NOVX protein sequence will  
10 indicate which regions of a NOVX polypeptide are particularly hydrophilic and, therefore, are likely to encode surface residues useful for targeting antibody production. As a means for targeting antibody production, hydropathy plots showing regions of hydrophilicity and hydrophobicity may be generated by any method well known in the art, including, for example, the Kyte Doolittle or the Hopp Woods methods, either with or without Fourier  
15 transformation. See, *e.g.*, Hopp and Woods, 1981, *Proc. Nat. Acad. Sci. USA* 78: 3824-3828; Kyte and Doolittle 1982, *J. Mol. Biol.* 157: 105-142, each incorporated herein by reference in their entirety. Antibodies that are specific for one or more domains within an antigenic protein, or derivatives, fragments, analogs or homologs thereof, are also provided herein.

A protein of the invention, or a derivative, fragment, analog, homolog or ortholog  
20 thereof, may be utilized as an immunogen in the generation of antibodies that immunospecifically bind these protein components.

Various procedures known within the art may be used for the production of polyclonal or monoclonal antibodies directed against a protein of the invention, or against derivatives, fragments, analogs homologs or orthologs thereof (see, for example, *Antibodies: A Laboratory*  
25 *Manual*, Harlow E, and Lane D, 1988, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY, incorporated herein by reference). Some of these antibodies are discussed below.

#### **Polyclonal Antibodies**

For the production of polyclonal antibodies, various suitable host animals (*e.g.*, rabbit, goat, mouse or other mammal) may be immunized by one or more injections with the native  
30 protein, a synthetic variant thereof, or a derivative of the foregoing. An appropriate immunogenic preparation can contain, for example, the naturally occurring immunogenic protein, a chemically synthesized polypeptide representing the immunogenic protein, or a recombinantly expressed immunogenic protein. Furthermore, the protein may be conjugated to a second protein known to be immunogenic in the mammal being immunized. Examples of

such immunogenic proteins include but are not limited to keyhole limpet hemocyanin, serum albumin, bovine thyroglobulin, and soybean trypsin inhibitor. The preparation can further include an adjuvant. Various adjuvants used to increase the immunological response include, but are not limited to, Freund's (complete and incomplete), mineral gels (e.g., aluminum  
5 hydroxide), surface active substances (e.g., lysolecithin, pluronic polyols, polyanions, peptides, oil emulsions, dinitrophenol, etc.), adjuvants usable in humans such as Bacille Calmette-Guerin and *Corynebacterium parvum*, or similar immunostimulatory agents. Additional examples of adjuvants which can be employed include MPL-TDM adjuvant (monophosphoryl Lipid A, synthetic trehalose dicorynomycolate).

10 The polyclonal antibody molecules directed against the immunogenic protein can be isolated from the mammal (e.g., from the blood) and further purified by well known techniques, such as affinity chromatography using protein A or protein G, which provide primarily the IgG fraction of immune serum. Subsequently, or alternatively, the specific antigen which is the target of the immunoglobulin sought, or an epitope thereof, may be  
15 immobilized on a column to purify the immune specific antibody by immunoaffinity chromatography. Purification of immunoglobulins is discussed, for example, by D. Wilkinson (The Scientist, published by The Scientist, Inc., Philadelphia PA, Vol. 14, No. 8 (April 17, 2000), pp. 25-28).

## 20 **Monoclonal Antibodies**

The term "monoclonal antibody" (MAb) or "monoclonal antibody composition", as used herein, refers to a population of antibody molecules that contain only one molecular species of antibody molecule consisting of a unique light chain gene product and a unique heavy chain gene product. In particular, the complementarity determining regions (CDRs) of  
25 the monoclonal antibody are identical in all the molecules of the population. MAbs thus contain an antigen binding site capable of immunoreacting with a particular epitope of the antigen characterized by a unique binding affinity for it.

Monoclonal antibodies can be prepared using hybridoma methods, such as those described by Kohler and Milstein, *Nature*, 256:495 (1975). In a hybridoma method, a mouse,  
30 hamster, or other appropriate host animal, is typically immunized with an immunizing agent to elicit lymphocytes that produce or are capable of producing antibodies that will specifically bind to the immunizing agent. Alternatively, the lymphocytes can be immunized in vitro.

The immunizing agent will typically include the protein antigen, a fragment thereof or a fusion protein thereof. Generally, either peripheral blood lymphocytes are used if cells of human origin are desired, or spleen cells or lymph node cells are used if non-human mammalian sources are desired. The lymphocytes are then fused with an immortalized cell  
5 line using a suitable fusing agent, such as polyethylene glycol, to form a hybridoma cell [Goding, Monoclonal Antibodies: Principles and Practice, Academic Press, (1986) pp. 59-103]. Immortalized cell lines are usually transformed mammalian cells, particularly myeloma cells of rodent, bovine and human origin. Usually, rat or mouse myeloma cell lines are employed. The hybridoma cells can be cultured in a suitable culture medium that preferably  
10 contains one or more substances that inhibit the growth or survival of the unfused, immortalized cells. For example, if the parental cells lack the enzyme hypoxanthine guanine phosphoribosyl transferase (HGPRT or HPRT), the culture medium for the hybridomas typically will include hypoxanthine, aminopterin, and thymidine ("HAT medium"), which substances prevent the growth of HGPRT-deficient cells.

15 Preferred immortalized cell lines are those that fuse efficiently, support stable high level expression of antibody by the selected antibody-producing cells, and are sensitive to a medium such as HAT medium. More preferred immortalized cell lines are murine myeloma lines, which can be obtained, for instance, from the Salk Institute Cell Distribution Center, San Diego, California and the American Type Culture Collection, Manassas, Virginia. Human  
20 myeloma and mouse-human heteromyeloma cell lines also have been described for the production of human monoclonal antibodies [Kozbor, J. Immunol., 133:3001 (1984); Brodeur et al., Monoclonal Antibody Production Techniques and Applications, Marcel Dekker, Inc., New York, (1987) pp. 51-63].

The culture medium in which the hybridoma cells are cultured can then be assayed for  
25 the presence of monoclonal antibodies directed against the antigen. Preferably, the binding specificity of monoclonal antibodies produced by the hybridoma cells is determined by immunoprecipitation or by an in vitro binding assay, such as radioimmunoassay (RIA) or enzyme-linked immunoabsorbent assay (ELISA). Such techniques and assays are known in the art. The binding affinity of the monoclonal antibody can, for example, be determined by  
30 the Scatchard analysis of Munson and Pollard, Anal. Biochem., 107:220 (1980). It is an objective, especially important in therapeutic applications of monoclonal antibodies, to identify antibodies having a high degree of specificity and a high binding affinity for the target antigen.

After the desired hybridoma cells are identified, the clones can be subcloned by limiting dilution procedures and grown by standard methods (Goding, 1986). Suitable culture media for this purpose include, for example, Dulbecco's Modified Eagle's Medium and RPMI-1640 medium. Alternatively, the hybridoma cells can be grown in vivo as ascites in a mammal.

The monoclonal antibodies secreted by the subclones can be isolated or purified from the culture medium or ascites fluid by conventional immunoglobulin purification procedures such as, for example, protein A-Sepharose, hydroxylapatite chromatography, gel electrophoresis, dialysis, or affinity chromatography.

The monoclonal antibodies can also be made by recombinant DNA methods, such as those described in U.S. Patent No. 4,816,567. DNA encoding the monoclonal antibodies of the invention can be readily isolated and sequenced using conventional procedures (e.g., by using oligonucleotide probes that are capable of binding specifically to genes encoding the heavy and light chains of murine antibodies). The hybridoma cells of the invention serve as a preferred source of such DNA. Once isolated, the DNA can be placed into expression vectors, which are then transfected into host cells such as simian COS cells, Chinese hamster ovary (CHO) cells, or myeloma cells that do not otherwise produce immunoglobulin protein, to obtain the synthesis of monoclonal antibodies in the recombinant host cells. The DNA also can be modified, for example, by substituting the coding sequence for human heavy and light chain constant domains in place of the homologous murine sequences (U.S. Patent No. 4,816,567; Morrison, *Nature* 368, 812-13 (1994)) or by covalently joining to the immunoglobulin coding sequence all or part of the coding sequence for a non-immunoglobulin polypeptide. Such a non-immunoglobulin polypeptide can be substituted for the constant domains of an antibody of the invention, or can be substituted for the variable domains of one antigen-combining site of an antibody of the invention to create a chimeric bivalent antibody.

### **Humanized Antibodies**

The antibodies directed against the protein antigens of the invention can further comprise humanized antibodies or human antibodies. These antibodies are suitable for administration to humans without engendering an immune response by the human against the administered immunoglobulin. Humanized forms of antibodies are chimeric immunoglobulins, immunoglobulin chains or fragments thereof (such as Fv, Fab, Fab', F(ab')<sub>2</sub> or other antigen-binding subsequences of antibodies) that are principally comprised of the sequence of a human immunoglobulin, and contain minimal sequence derived from a non-human immunoglobulin.

Humanization can be performed following the method of Winter and co-workers (Jones et al., Nature, 321:522-525 (1986); Riechmann et al., Nature, 332:323-327 (1988); Verhoeyen et al., Science, 239:1534-1536 (1988)), by substituting rodent CDRs or CDR sequences for the corresponding sequences of a human antibody. (See also U.S. Patent No. 5,225,539.) In some instances, Fv framework residues of the human immunoglobulin are replaced by corresponding non-human residues. Humanized antibodies can also comprise residues which are found neither in the recipient antibody nor in the imported CDR or framework sequences. In general, the humanized antibody will comprise substantially all of at least one, and typically two, variable domains, in which all or substantially all of the CDR regions correspond to those of a non-human immunoglobulin and all or substantially all of the framework regions are those of a human immunoglobulin consensus sequence. The humanized antibody optimally also will comprise at least a portion of an immunoglobulin constant region (Fc), typically that of a human immunoglobulin (Jones et al., 1986; Riechmann et al., 1988; and Presta, Curr. Op. Struct. Biol., 2:593-596 (1992)).

#### Human Antibodies

Fully human antibodies essentially relate to antibody molecules in which the entire sequence of both the light chain and the heavy chain, including the CDRs, arise from human genes. Such antibodies are termed "human antibodies", or "fully human antibodies" herein. Human monoclonal antibodies can be prepared by the trioma technique; the human B-cell hybridoma technique (see Kozbor, et al., 1983 Immunol Today 4: 72) and the EBV hybridoma technique to produce human monoclonal antibodies (see Cole, et al., 1985 In: MONOCLONAL ANTIBODIES AND CANCER THERAPY, Alan R. Liss, Inc., pp. 77-96). Human monoclonal antibodies may be utilized in the practice of the present invention and may be produced by using human hybridomas (see Cote, et al., 1983. Proc Natl Acad Sci USA 80: 2026-2030) or by transforming human B-cells with Epstein Barr Virus in vitro (see Cole, et al., 1985 In: MONOCLONAL ANTIBODIES AND CANCER THERAPY, Alan R. Liss, Inc., pp. 77-96).

In addition, human antibodies can also be produced using additional techniques, including phage display libraries (Hoogenboom and Winter, J. Mol. Biol., 227:381 (1991); Marks et al., J. Mol. Biol., 222:581 (1991)). Similarly, human antibodies can be made by introducing human immunoglobulin loci into transgenic animals, e.g., mice in which the endogenous immunoglobulin genes have been partially or completely inactivated. Upon challenge, human antibody production is observed, which closely resembles that seen in humans in all respects, including gene rearrangement, assembly, and antibody repertoire. This

approach is described, for example, in U.S. Patent Nos. 5,545,807; 5,545,806; 5,569,825; 5,625,126; 5,633,425; 5,661,016, and in Marks et al. (Bio/Technology 10, 779-783 (1992)); Lonberg et al. (Nature 368 856-859 (1994)); Morrison ( Nature 368, 812-13 (1994)); Fishwild et al, (Nature Biotechnology 14, 845-51 (1996)); Neuberger (Nature Biotechnology 14, 826  
5 (1996)); and Lonberg and Huszar (Intern. Rev. Immunol. 13 65-93 (1995)).

Human antibodies may additionally be produced using transgenic nonhuman animals which are modified so as to produce fully human antibodies rather than the animal's endogenous antibodies in response to challenge by an antigen. (See PCT publication WO94/02602). The endogenous genes encoding the heavy and light immunoglobulin chains in  
10 the nonhuman host have been incapacitated, and active loci encoding human heavy and light chain immunoglobulins are inserted into the host's genome. The human genes are incorporated, for example, using yeast artificial chromosomes containing the requisite human DNA segments. An animal which provides all the desired modifications is then obtained as progeny by crossbreeding intermediate transgenic animals containing fewer than the full  
15 complement of the modifications. The preferred embodiment of such a nonhuman animal is a mouse, and is termed the Xenomouse<sup>TM</sup> as disclosed in PCT publications WO 96/33735 and WO 96/34096. This animal produces B cells which secrete fully human immunoglobulins. The antibodies can be obtained directly from the animal after immunization with an immunogen of interest, as, for example, a preparation of a polyclonal antibody, or alternatively  
20 from immortalized B cells derived from the animal, such as hybridomas producing monoclonal antibodies. Additionally, the genes encoding the immunoglobulins with human variable regions can be recovered and expressed to obtain the antibodies directly, or can be further modified to obtain analogs of antibodies such as, for example, single chain Fv molecules.

25 An example of a method of producing a nonhuman host, exemplified as a mouse, lacking expression of an endogenous immunoglobulin heavy chain is disclosed in U.S. Patent No. 5,939,598. It can be obtained by a method including deleting the J segment genes from at least one endogenous heavy chain locus in an embryonic stem cell to prevent rearrangement of the locus and to prevent formation of a transcript of a rearranged immunoglobulin heavy chain  
30 locus, the deletion being effected by a targeting vector containing a gene encoding a selectable marker; and producing from the embryonic stem cell a transgenic mouse whose somatic and germ cells contain the gene encoding the selectable marker.

A method for producing an antibody of interest, such as a human antibody, is disclosed in U.S. Patent No. 5,916,771. It includes introducing an expression vector that contains a

nucleotide sequence encoding a heavy chain into one mammalian host cell in culture, introducing an expression vector containing a nucleotide sequence encoding a light chain into another mammalian host cell, and fusing the two cells to form a hybrid cell. The hybrid cell expresses an antibody containing the heavy chain and the light chain.

- 5 In a further improvement on this procedure, a method for identifying a clinically relevant epitope on an immunogen, and a correlative method for selecting an antibody that binds immunospecifically to the relevant epitope with high affinity, are disclosed in PCT publication WO 99/53049.

## 10 **F<sub>ab</sub> Fragments and Single Chain Antibodies**

- According to the invention, techniques can be adapted for the production of single-chain antibodies specific to an antigenic protein of the invention (see e.g., U.S. Patent No. 4,946,778). In addition, methods can be adapted for the construction of F<sub>ab</sub> expression libraries (see e.g., Huse, et al., 1989 Science 246: 1275-1281) to allow rapid and effective
- 15 identification of monoclonal F<sub>ab</sub> fragments with the desired specificity for a protein or derivatives, fragments, analogs or homologs thereof. Antibody fragments that contain the idiotypes to a protein antigen may be produced by techniques known in the art including, but not limited to: (i) an F<sub>(ab)<sub>2</sub></sub> fragment produced by pepsin digestion of an antibody molecule; (ii) an F<sub>ab</sub> fragment generated by reducing the disulfide bridges of an F<sub>(ab)<sub>2</sub></sub> fragment; (iii) an F<sub>ab</sub>
- 20 fragment generated by the treatment of the antibody molecule with papain and a reducing agent and (iv) F<sub>v</sub> fragments.

## **Bispecific Antibodies**

- Bispecific antibodies are monoclonal, preferably human or humanized, antibodies that
- 25 have binding specificities for at least two different antigens. In the present case, one of the binding specificities is for an antigenic protein of the invention. The second binding target is any other antigen, and advantageously is a cell-surface protein or receptor or receptor subunit.

- Methods for making bispecific antibodies are known in the art. Traditionally, the recombinant production of bispecific antibodies is based on the co-expression of two
- 30 immunoglobulin heavy-chain/light-chain pairs, where the two heavy chains have different specificities (Milstein and Cuello, *Nature*, 305:537-539 (1983)). Because of the random assortment of immunoglobulin heavy and light chains, these hybridomas (quadromas) produce a potential mixture of ten different antibody molecules, of which only one has the correct

bispecific structure. The purification of the correct molecule is usually accomplished by affinity chromatography steps. Similar procedures are disclosed in WO 93/08829, published 13 May 1993, and in Traunecker et al., EMBO J., 10:3655-3659 (1991).

Antibody variable domains with the desired binding specificities (antibody-antigen  
5 combining sites) can be fused to immunoglobulin constant domain sequences. The fusion preferably is with an immunoglobulin heavy-chain constant domain, comprising at least part of the hinge, CH2, and CH3 regions. It is preferred to have the first heavy-chain constant region (CH1) containing the site necessary for light-chain binding present in at least one of the fusions. DNAs encoding the immunoglobulin heavy-chain fusions and, if desired, the  
10 immunoglobulin light chain, are inserted into separate expression vectors, and are co-transfected into a suitable host organism. For further details of generating bispecific antibodies see, for example, Suresh et al., Methods in Enzymology, 121:210 (1986).

According to another approach described in WO 96/27011, the interface between a pair  
15 of antibody molecules can be engineered to maximize the percentage of heterodimers which are recovered from recombinant cell culture. The preferred interface comprises at least a part of the CH3 region of an antibody constant domain. In this method, one or more small amino acid side chains from the interface of the first antibody molecule are replaced with larger side chains (e.g. tyrosine or tryptophan). Compensatory "cavities" of identical or similar size to the large side chain(s) are created on the interface of the second antibody molecule by replacing  
20 large amino acid side chains with smaller ones (e.g. alanine or threonine). This provides a mechanism for increasing the yield of the heterodimer over other unwanted end-products such as homodimers.

Bispecific antibodies can be prepared as full length antibodies or antibody fragments (e.g. F(ab')<sub>2</sub> bispecific antibodies). Techniques for generating bispecific antibodies from  
25 antibody fragments have been described in the literature. For example, bispecific antibodies can be prepared using chemical linkage. Brennan et al., Science 229:81 (1985) describe a procedure wherein intact antibodies are proteolytically cleaved to generate F(ab')<sub>2</sub> fragments. These fragments are reduced in the presence of the dithiol complexing agent sodium arsenite to stabilize vicinal dithiols and prevent intermolecular disulfide formation. The Fab'  
30 fragments generated are then converted to thionitrobenzoate (TNB) derivatives. One of the Fab'-TNB derivatives is then reconverted to the Fab'-thiol by reduction with mercaptoethylamine and is mixed with an equimolar amount of the other Fab'-TNB derivative to form the bispecific antibody. The bispecific antibodies produced can be used as agents for the selective immobilization of enzymes.

Additionally, Fab' fragments can be directly recovered from *E. coli* and chemically coupled to form bispecific antibodies. Shalaby et al., J. Exp. Med. 175:217-225 (1992) describe the production of a fully humanized bispecific antibody F(ab')<sub>2</sub> molecule. Each Fab' fragment was separately secreted from *E. coli* and subjected to directed chemical coupling in vitro to form the bispecific antibody. The bispecific antibody thus formed was able to bind to cells overexpressing the ErbB2 receptor and normal human T cells, as well as trigger the lytic activity of human cytotoxic lymphocytes against human breast tumor targets.

Various techniques for making and isolating bispecific antibody fragments directly from recombinant cell culture have also been described. For example, bispecific antibodies have been produced using leucine zippers. Kostelny et al., J. Immunol. 148(5):1547-1553 (1992). The leucine zipper peptides from the Fos and Jun proteins were linked to the Fab' portions of two different antibodies by gene fusion. The antibody homodimers were reduced at the hinge region to form monomers and then re-oxidized to form the antibody heterodimers. This method can also be utilized for the production of antibody homodimers. The "diabody" technology described by Hollinger et al., Proc. Natl. Acad. Sci. USA 90:6444-6448 (1993) has provided an alternative mechanism for making bispecific antibody fragments. The fragments comprise a heavy-chain variable domain (V<sub>H</sub>) connected to a light-chain variable domain (V<sub>L</sub>) by a linker which is too short to allow pairing between the two domains on the same chain. Accordingly, the V<sub>H</sub> and V<sub>L</sub> domains of one fragment are forced to pair with the complementary V<sub>L</sub> and V<sub>H</sub> domains of another fragment, thereby forming two antigen-binding sites. Another strategy for making bispecific antibody fragments by the use of single-chain Fv (sFv) dimers has also been reported. See, Gruber et al., J. Immunol. 152:5368 (1994).

Antibodies with more than two valencies are contemplated. For example, trispecific antibodies can be prepared. Tutt et al., J. Immunol. 147:60 (1991).

Exemplary bispecific antibodies can bind to two different epitopes, at least one of which originates in the protein antigen of the invention. Alternatively, an anti-antigenic arm of an immunoglobulin molecule can be combined with an arm which binds to a triggering molecule on a leukocyte such as a T-cell receptor molecule (e.g. CD2, CD3, CD28, or B7), or Fc receptors for IgG (FcγR), such as FcγRI (CD64), FcγRII (CD32) and FcγRIII (CD16) so as to focus cellular defense mechanisms to the cell expressing the particular antigen. Bispecific antibodies can also be used to direct cytotoxic agents to cells which express a particular antigen. These antibodies possess an antigen-binding arm and an arm which binds a cytotoxic agent or a radionuclide chelator, such as EOTUBE, DPTA, DOTA, or TETA. Another

bispecific antibody of interest binds the protein antigen described herein and further binds tissue factor (TF).

### **Heteroconjugate Antibodies**

5 Heteroconjugate antibodies are also within the scope of the present invention. Heteroconjugate antibodies are composed of two covalently joined antibodies. Such antibodies have, for example, been proposed to target immune system cells to unwanted cells (U.S. Patent No. 4,676,980), and for treatment of HIV infection (WO 91/00360; WO 92/200373; EP 03089). It is contemplated that the antibodies can be prepared in vitro using  
10 known methods in synthetic protein chemistry, including those involving crosslinking agents. For example, immunotoxins can be constructed using a disulfide exchange reaction or by forming a thioether bond. Examples of suitable reagents for this purpose include iminothiolate and methyl-4-mercaptobutyrimidate and those disclosed, for example, in U.S. Patent No. 4,676,980.

15

### **Effector Function Engineering**

It can be desirable to modify the antibody of the invention with respect to effector function, so as to enhance, e.g., the effectiveness of the antibody in treating cancer. For example, cysteine residue(s) can be introduced into the Fc region, thereby allowing interchain  
20 disulfide bond formation in this region. The homodimeric antibody thus generated can have improved internalization capability and/or increased complement-mediated cell killing and antibody-dependent cellular cytotoxicity (ADCC). See Caron et al., *J. Exp Med.*, 176: 1191-1195 (1992) and Shopes, *J. Immunol.*, 148: 2918-2922 (1992). Homodimeric antibodies with enhanced anti-tumor activity can also be prepared using heterobifunctional cross-linkers as  
25 described in Wolff et al. *Cancer Research*, 53: 2560-2565 (1993). Alternatively, an antibody can be engineered that has dual Fc regions and can thereby have enhanced complement lysis and ADCC capabilities. See Stevenson et al., *Anti-Cancer Drug Design*, 3: 219-230 (1989).

### **Immunoconjugates**

30 The invention also pertains to immunoconjugates comprising an antibody conjugated to a cytotoxic agent such as a chemotherapeutic agent, toxin (e.g., an enzymatically active toxin of bacterial, fungal, plant, or animal origin, or fragments thereof), or a radioactive isotope (i.e., a radioconjugate).

Chemotherapeutic agents useful in the generation of such immunoconjugates have  
35 been described above. Enzymatically active toxins and fragments thereof that can be used

include diphtheria A chain, nonbinding active fragments of diphtheria toxin, exotoxin A chain (from *Pseudomonas aeruginosa*), ricin A chain, abrin A chain, modeccin A chain, alpha-sarcin, Aleurites fordii proteins, dianthin proteins, *Phytolacca americana* proteins (PAPI, PAPII, and PAP-S), momordica charantia inhibitor, curcin, crotin, sapaonaria officinalis inhibitor, gelonin, mitogellin, restrictocin, phenomycin, enomycin, and the tricothecenes. A variety of radionuclides are available for the production of radioconjugated antibodies. Examples include  $^{212}\text{Bi}$ ,  $^{131}\text{I}$ ,  $^{131}\text{In}$ ,  $^{90}\text{Y}$ , and  $^{186}\text{Re}$ .

Conjugates of the antibody and cytotoxic agent are made using a variety of bifunctional protein-coupling agents such as N-succinimidyl-3-(2-pyridyldithiol) propionate (SPDP), iminothiolane (IT), bifunctional derivatives of imidoesters (such as dimethyl adipimidate HCL), active esters (such as disuccinimidyl suberate), aldehydes (such as glutaraldehyde), bis-azido compounds (such as bis (p-azidobenzoyl) hexanediamine), bis-diazonium derivatives (such as bis-(p-diazoniumbenzoyl)-ethylenediamine), diisocyanates (such as tolyene 2,6-diisocyanate), and bis-active fluorine compounds (such as 1,5-difluoro-2,4-dinitrobenzene). For example, a ricin immunotoxin can be prepared as described in Vitetta et al., Science, 238: 1098 (1987). Carbon-14-labeled 1-isothiocyanatobenzyl-3-methyldiethylene triaminepentaacetic acid (MX-DTPA) is an exemplary chelating agent for conjugation of radionucleotide to the antibody. See WO94/11026.

In another embodiment, the antibody can be conjugated to a "receptor" (such as streptavidin) for utilization in tumor pretargeting wherein the antibody-receptor conjugate is administered to the patient, followed by removal of unbound conjugate from the circulation using a clearing agent and then administration of a "ligand" (e.g., avidin) that is in turn conjugated to a cytotoxic agent.

## Immunoliposomes

The antibodies disclosed herein can also be formulated as immunoliposomes. Liposomes containing the antibody are prepared by methods known in the art, such as described in Epstein et al., Proc. Natl. Acad. Sci. USA, 82: 3688 (1985); Hwang et al., Proc. Natl. Acad. Sci. USA, 77: 4030 (1980); and U.S. Pat. Nos. 4,485,045 and 4,544,545. Liposomes with enhanced circulation time are disclosed in U.S. Patent No. 5,013,556.

Particularly useful liposomes can be generated by the reverse-phase evaporation method with a lipid composition comprising phosphatidylcholine, cholesterol, and PEG-derivatized phosphatidylethanolamine (PEG-PE). Liposomes are extruded through filters of defined pore size to yield liposomes with the desired diameter. Fab' fragments of the antibody

of the present invention can be conjugated to the liposomes as described in Martin et al., J. Biol. Chem., 257: 286-288 (1982) via a disulfide-interchange reaction. A chemotherapeutic agent (such as Doxorubicin) is optionally contained within the liposome. See Gabizon et al., J. National Cancer Inst., 81(19): 1484 (1989).

5

### **Diagnostic Applications of Antibodies Directed Against the Proteins of the Invention**

Antibodies directed against a protein of the invention may be used in methods known within the art relating to the localization and/or quantitation of the protein (e.g., for use in measuring levels of the protein within appropriate physiological samples, for use in diagnostic methods, for use in imaging the protein, and the like). In a given embodiment, antibodies against the proteins, or derivatives, fragments, analogs or homologs thereof, that contain the antigen binding domain, are utilized as pharmacologically-active compounds (see below).

An antibody specific for a protein of the invention can be used to isolate the protein by standard techniques, such as immunoaffinity chromatography or immunoprecipitation. Such an antibody can facilitate the purification of the natural protein antigen from cells and of recombinantly produced antigen expressed in host cells. Moreover, such an antibody can be used to detect the antigenic protein (e.g., in a cellular lysate or cell supernatant) in order to evaluate the abundance and pattern of expression of the antigenic protein. Antibodies directed against the protein can be used diagnostically to monitor protein levels in tissue as part of a clinical testing procedure, e.g., to, for example, determine the efficacy of a given treatment regimen. Detection can be facilitated by coupling (i.e., physically linking) the antibody to a detectable substance. Examples of detectable substances include various enzymes, prosthetic groups, fluorescent materials, luminescent materials, bioluminescent materials, and radioactive materials. Examples of suitable enzymes include horseradish peroxidase, alkaline phosphatase,  $\beta$ -galactosidase, or acetylcholinesterase; examples of suitable prosthetic group complexes include streptavidin/biotin and avidin/biotin; examples of suitable fluorescent materials include umbelliferone, fluorescein, fluorescein isothiocyanate, rhodamine, dichlorotriazinylamine fluorescein, dansyl chloride or phycoerythrin; an example of a luminescent material includes luminol; examples of bioluminescent materials include luciferase, luciferin, and aequorin, and examples of suitable radioactive material include  $^{125}\text{I}$ ,  $^{131}\text{I}$ ,  $^{35}\text{S}$  or  $^3\text{H}$ .

30

### **Antibody Therapeutics**

Antibodies of the invention, including polyclonal, monoclonal, humanized and fully human antibodies, may be used as therapeutic agents. Such agents will generally be employed to treat or prevent a disease or pathology in a subject. An antibody preparation, preferably one having high specificity and high affinity for its target antigen, is administered to the subject  
5 and will generally have an effect due to its binding with the target. Such an effect may be one of two kinds, depending on the specific nature of the interaction between the given antibody molecule and the target antigen in question. In the first instance, administration of the antibody may abrogate or inhibit the binding of the target with an endogenous ligand to which it naturally binds. In this case, the antibody binds to the target and masks a binding site of the  
10 naturally occurring ligand, wherein the ligand serves as an effector molecule. Thus the receptor mediates a signal transduction pathway for which ligand is responsible.

Alternatively, the effect may be one in which the antibody elicits a physiological result by virtue of binding to an effector binding site on the target molecule. In this case the target, a receptor having an endogenous ligand which may be absent or defective in the disease or  
15 pathology, binds the antibody as a surrogate effector ligand, initiating a receptor-based signal transduction event by the receptor.

A therapeutically effective amount of an antibody of the invention relates generally to the amount needed to achieve a therapeutic objective. As noted above, this may be a binding interaction between the antibody and its target antigen that, in certain cases, interferes with the  
20 functioning of the target, and in other cases, promotes a physiological response. The amount required to be administered will furthermore depend on the binding affinity of the antibody for its specific antigen, and will also depend on the rate at which an administered antibody is depleted from the free volume of the subject to which it is administered. Common ranges for therapeutically effective dosing of an antibody or antibody fragment of the invention may be,  
25 by way of nonlimiting example, from about 0.1 mg/kg body weight to about 50 mg/kg body weight. Common dosing frequencies may range, for example, from twice daily to once a week.

### **Pharmaceutical Compositions of Antibodies**

30 Antibodies specifically binding a protein of the invention, as well as other molecules identified by the screening assays disclosed herein, can be administered for the treatment of various disorders in the form of pharmaceutical compositions. Principles and considerations involved in preparing such compositions, as well as guidance in the choice of components are provided, for example, in Remington : The Science And Practice Of Pharmacy 19th ed.

(Alfonso R. Gennaro, et al., editors) Mack Pub. Co., Easton, Pa. : 1995; Drug Absorption Enhancement : Concepts, Possibilities, Limitations, And Trends, Harwood Academic Publishers, Langhorne, Pa., 1994; and Peptide And Protein Drug Delivery (Advances In Parenteral Sciences, Vol. 4), 1991, M. Dekker, New York.

5           If the antigenic protein is intracellular and whole antibodies are used as inhibitors, internalizing antibodies are preferred. However, liposomes can also be used to deliver the antibody, or an antibody fragment, into cells. Where antibody fragments are used, the smallest inhibitory fragment that specifically binds to the binding domain of the target protein is preferred. For example, based upon the variable-region sequences of an antibody, peptide  
10       molecules can be designed that retain the ability to bind the target protein sequence. Such peptides can be synthesized chemically and/or produced by recombinant DNA technology. See, e.g., Marasco et al., Proc. Natl. Acad. Sci. USA, 90: 7889-7893 (1993). The formulation herein can also contain more than one active compound as necessary for the particular indication being treated, preferably those with complementary activities that do not adversely  
15       affect each other. Alternatively, or in addition, the composition can comprise an agent that enhances its function, such as, for example, a cytotoxic agent, cytokine, chemotherapeutic agent, or growth-inhibitory agent. Such molecules are suitably present in combination in amounts that are effective for the purpose intended.

          The active ingredients can also be entrapped in microcapsules prepared, for example,  
20       by coacervation techniques or by interfacial polymerization, for example, hydroxymethylcellulose or gelatin-microcapsules and poly-(methylmethacrylate) microcapsules, respectively, in colloidal drug delivery systems (for example, liposomes, albumin microspheres, microemulsions, nano-particles, and nanocapsules) or in macroemulsions.

25           The formulations to be used for in vivo administration must be sterile. This is readily accomplished by filtration through sterile filtration membranes.

          Sustained-release preparations can be prepared. Suitable examples of sustained-release preparations include semipermeable matrices of solid hydrophobic polymers containing the antibody, which matrices are in the form of shaped articles, e.g., films, or  
30       microcapsules. Examples of sustained-release matrices include polyesters, hydrogels (for example, poly(2-hydroxyethyl-methacrylate), or poly(vinylalcohol)), polylactides (U.S. Pat. No. 3,773,919), copolymers of L-glutamic acid and  $\gamma$  ethyl-L-glutamate, non-degradable ethylene-vinyl acetate, degradable lactic acid-glycolic acid copolymers such as the LUPRON DEPOT<sup>TM</sup> (injectable microspheres composed of lactic acid-glycolic acid copolymer and

leuprolide acetate), and poly-D-(-)-3-hydroxybutyric acid. While polymers such as ethylene-vinyl acetate and lactic acid-glycolic acid enable release of molecules for over 100 days, certain hydrogels release proteins for shorter time periods.

## 5 ELISA Assay

An agent for detecting an analyte protein is an antibody capable of binding to an analyte protein, preferably an antibody with a detectable label. Antibodies can be polyclonal, or more preferably, monoclonal. An intact antibody, or a fragment thereof (*e.g.*,  $F_{ab}$  or  $F_{(ab)2}$ ) can be used. The term "labeled", with regard to the probe or antibody, is intended to encompass direct labeling of the probe or antibody by coupling (*i.e.*, physically linking) a detectable substance to the probe or antibody, as well as indirect labeling of the probe or antibody by reactivity with another reagent that is directly labeled. Examples of indirect labeling include detection of a primary antibody using a fluorescently-labeled secondary antibody and end-labeling of a DNA probe with biotin such that it can be detected with fluorescently-labeled streptavidin. The term "biological sample" is intended to include tissues, cells and biological fluids isolated from a subject, as well as tissues, cells and fluids present within a subject. Included within the usage of the term "biological sample", therefore, is blood and a fraction or component of blood including blood serum, blood plasma, or lymph. That is, the detection method of the invention can be used to detect an analyte mRNA, protein, or genomic DNA in a biological sample *in vitro* as well as *in vivo*. For example, *in vitro* techniques for detection of an analyte mRNA include Northern hybridizations and *in situ* hybridizations. *In vitro* techniques for detection of an analyte protein include enzyme linked immunosorbent assays (ELISAs), Western blots, immunoprecipitations, and immunofluorescence. *In vitro* techniques for detection of an analyte genomic DNA include Southern hybridizations. Procedures for conducting immunoassays are described, for example in "ELISA: Theory and Practice: Methods in Molecular Biology", Vol. 42, J. R. Crowther (Ed.) Human Press, Totowa, NJ, 1995; "Immunoassay", E. Diamandis and T. Christopoulos, Academic Press, Inc., San Diego, CA, 1996; and "Practice and Theory of Enzyme Immunoassays", P. Tijssen, Elsevier Science Publishers, Amsterdam, 1985. Furthermore, *in vivo* techniques for detection of an analyte protein include introducing into a subject a labeled anti-analyte protein antibody. For example, the antibody can be labeled with a radioactive marker whose presence and location in a subject can be detected by standard imaging techniques.

### NOVX Recombinant Expression Vectors and Host Cells

Another aspect of the invention pertains to vectors, preferably expression vectors, containing a nucleic acid encoding an NOVX protein, or derivatives, fragments, analogs or homologs thereof. As used herein, the term "vector" refers to a nucleic acid molecule capable of transporting another nucleic acid to which it has been linked. One type of vector is a "plasmid", which refers to a circular double stranded DNA loop into which additional DNA segments can be ligated. Another type of vector is a viral vector, wherein additional DNA segments can be ligated into the viral genome. Certain vectors are capable of autonomous replication in a host cell into which they are introduced (*e.g.*, bacterial vectors having a bacterial origin of replication and episomal mammalian vectors). Other vectors (*e.g.*, non-episomal mammalian vectors) are integrated into the genome of a host cell upon introduction into the host cell, and thereby are replicated along with the host genome. Moreover, certain vectors are capable of directing the expression of genes to which they are operatively-linked. Such vectors are referred to herein as "expression vectors". In general, expression vectors of utility in recombinant DNA techniques are often in the form of plasmids. In the present specification, "plasmid" and "vector" can be used interchangeably as the plasmid is the most commonly used form of vector. However, the invention is intended to include such other forms of expression vectors, such as viral vectors (*e.g.*, replication defective retroviruses, adenoviruses and adeno-associated viruses), which serve equivalent functions.

The recombinant expression vectors of the invention comprise a nucleic acid of the invention in a form suitable for expression of the nucleic acid in a host cell, which means that the recombinant expression vectors include one or more regulatory sequences, selected on the basis of the host cells to be used for expression, that is operatively-linked to the nucleic acid sequence to be expressed. Within a recombinant expression vector, "operably-linked" is intended to mean that the nucleotide sequence of interest is linked to the regulatory sequence(s) in a manner that allows for expression of the nucleotide sequence (*e.g.*, in an *in vitro* transcription/translation system or in a host cell when the vector is introduced into the host cell).

The term "regulatory sequence" is intended to include promoters, enhancers and other expression control elements (*e.g.*, polyadenylation signals). Such regulatory sequences are described, for example, in Goeddel, GENE EXPRESSION TECHNOLOGY: METHODS IN ENZYMOLOGY 185, Academic Press, San Diego, Calif. (1990). Regulatory sequences include those that direct constitutive expression of a nucleotide sequence in many types of host cell and those that direct expression of the nucleotide sequence only in certain host cells (*e.g.*,

tissue-specific regulatory sequences). It will be appreciated by those skilled in the art that the design of the expression vector can depend on such factors as the choice of the host cell to be transformed, the level of expression of protein desired, etc. The expression vectors of the invention can be introduced into host cells to thereby produce proteins or peptides, including  
5 fusion proteins or peptides, encoded by nucleic acids as described herein (e.g., NOVX proteins, mutant forms of NOVX proteins, fusion proteins, etc.).

The recombinant expression vectors of the invention can be designed for expression of NOVX proteins in prokaryotic or eukaryotic cells. For example, NOVX proteins can be expressed in bacterial cells such as *Escherichia coli*, insect cells (using baculovirus expression  
10 vectors) yeast cells or mammalian cells. Suitable host cells are discussed further in Goeddel, GENE EXPRESSION TECHNOLOGY: METHODS IN ENZYMOLOGY 185, Academic Press, San Diego, Calif. (1990). Alternatively, the recombinant expression vector can be transcribed and translated *in vitro*, for example using T7 promoter regulatory sequences and T7 polymerase.

Expression of proteins in prokaryotes is most often carried out in *Escherichia coli* with  
15 vectors containing constitutive or inducible promoters directing the expression of either fusion or non-fusion proteins. Fusion vectors add a number of amino acids to a protein encoded therein, usually to the amino terminus of the recombinant protein. Such fusion vectors typically serve three purposes: (i) to increase expression of recombinant protein; (ii) to increase the solubility of the recombinant protein; and (iii) to aid in the purification of the  
20 recombinant protein by acting as a ligand in affinity purification. Often, in fusion expression vectors, a proteolytic cleavage site is introduced at the junction of the fusion moiety and the recombinant protein to enable separation of the recombinant protein from the fusion moiety subsequent to purification of the fusion protein. Such enzymes, and their cognate recognition sequences, include Factor Xa, thrombin and enterokinase. Typical fusion expression vectors  
25 include pGEX (Pharmacia Biotech Inc; Smith and Johnson, 1988. *Gene* 67: 31-40), pMAL (New England Biolabs, Beverly, Mass.) and pRIT5 (Pharmacia, Piscataway, N.J.) that fuse glutathione S-transferase (GST), maltose E binding protein, or protein A, respectively, to the target recombinant protein.

Examples of suitable inducible non-fusion *E. coli* expression vectors include pTrc  
30 (Amrann *et al.*, (1988) *Gene* 69:301-315) and pET 11d (Studier *et al.*, GENE EXPRESSION TECHNOLOGY: METHODS IN ENZYMOLOGY 185, Academic Press, San Diego, Calif. (1990) 60-89).

One strategy to maximize recombinant protein expression in *E. coli* is to express the protein in a host bacteria with an impaired capacity to proteolytically cleave the recombinant

protein. See, e.g., Gottesman, GENE EXPRESSION TECHNOLOGY: METHODS IN ENZYMOLOGY 185, Academic Press, San Diego, Calif. (1990) 119-128. Another strategy is to alter the nucleic acid sequence of the nucleic acid to be inserted into an expression vector so that the individual codons for each amino acid are those preferentially utilized in *E. coli* (see, e.g.,  
5 Wada, *et al.*, 1992. *Nucl. Acids Res.* 20: 2111-2118). Such alteration of nucleic acid sequences of the invention can be carried out by standard DNA synthesis techniques.

In another embodiment, the NOVX expression vector is a yeast expression vector. Examples of vectors for expression in yeast *Saccharomyces cerevisiae* include pYepSec1 (Baldari, *et al.*, 1987. *EMBO J.* 6: 229-234), pMFa (Kurjan and Herskowitz, 1982. *Cell* 30:  
10 933-943), pJRY88 (Schultz *et al.*, 1987. *Gene* 54: 113-123), pYES2 (Invitrogen Corporation, San Diego, Calif.), and picZ (InVitrogen Corp, San Diego, Calif.).

Alternatively, NOVX can be expressed in insect cells using baculovirus expression vectors. Baculovirus vectors available for expression of proteins in cultured insect cells (e.g., SF9 cells) include the pAc series (Smith, *et al.*, 1983. *Mol. Cell. Biol.* 3: 2156-2165) and the  
15 pVL series (Lucklow and Summers, 1989. *Virology* 170: 31-39).

In yet another embodiment, a nucleic acid of the invention is expressed in mammalian cells using a mammalian expression vector. Examples of mammalian expression vectors include pCDM8 (Seed, 1987. *Nature* 329: 840) and pMT2PC (Kaufman, *et al.*, 1987. *EMBO J.* 6: 187-195). When used in mammalian cells, the expression vector's control functions are  
20 often provided by viral regulatory elements. For example, commonly used promoters are derived from polyoma, adenovirus 2, cytomegalovirus, and simian virus 40. For other suitable expression systems for both prokaryotic and eukaryotic cells see, e.g., Chapters 16 and 17 of Sambrook, *et al.*, MOLECULAR CLONING: A LABORATORY MANUAL. 2nd ed., Cold Spring Harbor Laboratory, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y., 1989.

25 In another embodiment, the recombinant mammalian expression vector is capable of directing expression of the nucleic acid preferentially in a particular cell type (e.g., tissue-specific regulatory elements are used to express the nucleic acid). Tissue-specific regulatory elements are known in the art. Non-limiting examples of suitable tissue-specific promoters include the albumin promoter (liver-specific; Pinkert, *et al.*, 1987. *Genes Dev.* 1: 268-277), lymphoid-specific promoters (Calame and Eaton, 1988. *Adv. Immunol.* 43: 235-275), in particular promoters of T cell receptors (Winoto and Baltimore, 1989. *EMBO J.* 8: 729-733) and immunoglobulins (Banerji, *et al.*, 1983. *Cell* 33: 729-740; Queen and Baltimore, 1983. *Cell* 33: 741-748), neuron-specific promoters (e.g., the neurofilament promoter; Byrne and Ruddle, 1989. *Proc. Natl. Acad. Sci. USA* 86: 5473-5477),  
30

pancreas-specific promoters (Edlund, *et al.*, 1985. *Science* 230: 912-916), and mammary gland-specific promoters (*e.g.*, milk whey promoter; U.S. Pat. No. 4,873,316 and European Application Publication No. 264,166). Developmentally-regulated promoters are also encompassed, *e.g.*, the murine hox promoters (Kessel and Gruss, 1990. *Science* 249: 374-379) and the  $\alpha$ -fetoprotein promoter (Campes and Tilghman, 1989. *Genes Dev.* 3: 537-546).

The invention further provides a recombinant expression vector comprising a DNA molecule of the invention cloned into the expression vector in an antisense orientation. That is, the DNA molecule is operatively-linked to a regulatory sequence in a manner that allows for expression (by transcription of the DNA molecule) of an RNA molecule that is antisense to NOVX mRNA. Regulatory sequences operatively linked to a nucleic acid cloned in the antisense orientation can be chosen that direct the continuous expression of the antisense RNA molecule in a variety of cell types, for instance viral promoters and/or enhancers, or regulatory sequences can be chosen that direct constitutive, tissue specific or cell type specific expression of antisense RNA. The antisense expression vector can be in the form of a recombinant plasmid, phagemid or attenuated virus in which antisense nucleic acids are produced under the control of a high efficiency regulatory region, the activity of which can be determined by the cell type into which the vector is introduced. For a discussion of the regulation of gene expression using antisense genes *see, e.g.*, Weintraub, *et al.*, "Antisense RNA as a molecular tool for genetic analysis," *Reviews-Trends in Genetics*, Vol. 1(1) 1986.

Another aspect of the invention pertains to host cells into which a recombinant expression vector of the invention has been introduced. The terms "host cell" and "recombinant host cell" are used interchangeably herein. It is understood that such terms refer not only to the particular subject cell but also to the progeny or potential progeny of such a cell. Because certain modifications may occur in succeeding generations due to either mutation or environmental influences, such progeny may not, in fact, be identical to the parent cell, but are still included within the scope of the term as used herein.

A host cell can be any prokaryotic or eukaryotic cell. For example, NOVX protein can be expressed in bacterial cells such as *E. coli*, insect cells, yeast or mammalian cells (such as Chinese hamster ovary cells (CHO) or COS cells). Other suitable host cells are known to those skilled in the art.

Vector DNA can be introduced into prokaryotic or eukaryotic cells via conventional transformation or transfection techniques. As used herein, the terms "transformation" and "transfection" are intended to refer to a variety of art-recognized techniques for introducing foreign nucleic acid (*e.g.*, DNA) into a host cell, including calcium phosphate or calcium

chloride co-precipitation, DEAE-dextran-mediated transfection, lipofection, or electroporation. Suitable methods for transforming or transfecting host cells can be found in Sambrook, *et al.* (MOLECULAR CLONING: A LABORATORY MANUAL. 2nd ed., Cold Spring Harbor Laboratory, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y., 1989), and other laboratory manuals.

For stable transfection of mammalian cells, it is known that, depending upon the expression vector and transfection technique used, only a small fraction of cells may integrate the foreign DNA into their genome. In order to identify and select these integrants, a gene that encodes a selectable marker (*e.g.*, resistance to antibiotics) is generally introduced into the host cells along with the gene of interest. Various selectable markers include those that confer resistance to drugs, such as G418, hygromycin and methotrexate. Nucleic acid encoding a selectable marker can be introduced into a host cell on the same vector as that encoding NOVX or can be introduced on a separate vector. Cells stably transfected with the introduced nucleic acid can be identified by drug selection (*e.g.*, cells that have incorporated the selectable marker gene will survive, while the other cells die).

A host cell of the invention, such as a prokaryotic or eukaryotic host cell in culture, can be used to produce (*i.e.*, express) NOVX protein. Accordingly, the invention further provides methods for producing NOVX protein using the host cells of the invention. In one embodiment, the method comprises culturing the host cell of invention (into which a recombinant expression vector encoding NOVX protein has been introduced) in a suitable medium such that NOVX protein is produced. In another embodiment, the method further comprises isolating NOVX protein from the medium or the host cell.

### Transgenic NOVX Animals

The host cells of the invention can also be used to produce non-human transgenic animals. For example, in one embodiment, a host cell of the invention is a fertilized oocyte or an embryonic stem cell into which NOVX protein-coding sequences have been introduced. Such host cells can then be used to create non-human transgenic animals in which exogenous NOVX sequences have been introduced into their genome or homologous recombinant animals in which endogenous NOVX sequences have been altered. Such animals are useful for studying the function and/or activity of NOVX protein and for identifying and/or evaluating modulators of NOVX protein activity. As used herein, a "transgenic animal" is a non-human animal, preferably a mammal, more preferably a rodent such as a rat or mouse, in which one or more of the cells of the animal includes a transgene. Other examples of

transgenic animals include non-human primates, sheep, dogs, cows, goats, chickens, amphibians, etc. A transgene is exogenous DNA that is integrated into the genome of a cell from which a transgenic animal develops and that remains in the genome of the mature animal, thereby directing the expression of an encoded gene product in one or more cell types or tissues of the transgenic animal. As used herein, a "homologous recombinant animal" is a non-human animal, preferably a mammal, more preferably a mouse, in which an endogenous NOVX gene has been altered by homologous recombination between the endogenous gene and an exogenous DNA molecule introduced into a cell of the animal, *e.g.*, an embryonic cell of the animal, prior to development of the animal.

10 A transgenic animal of the invention can be created by introducing NOVX-encoding nucleic acid into the male pronuclei of a fertilized oocyte (*e.g.*, by microinjection, retroviral infection) and allowing the oocyte to develop in a pseudopregnant female foster animal. The human NOVX cDNA sequences SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 can be introduced as a transgene into the genome of a non-human animal. Alternatively, a non-human homologue of the human NOVX gene, such as a mouse NOVX gene, can be isolated based on hybridization to the human NOVX cDNA (described further *supra*) and used as a transgene. Intronic sequences and polyadenylation signals can also be included in the transgene to increase the efficiency of expression of the transgene. A tissue-specific regulatory sequence(s) can be operably-linked to the NOVX transgene to direct expression of NOVX protein to particular cells. Methods for generating transgenic animals via embryo manipulation and microinjection, particularly animals such as mice, have become conventional in the art and are described, for example, in U.S. Patent Nos. 4,736,866; 4,870,009; and 4,873,191; and Hogan, 1986. In: MANIPULATING THE MOUSE EMBRYO, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, N.Y. Similar methods are used for production of other transgenic animals. A transgenic founder animal can be identified based upon the presence of the NOVX transgene in its genome and/or expression of NOVX mRNA in tissues or cells of the animals. A transgenic founder animal can then be used to breed additional animals carrying the transgene. Moreover, transgenic animals carrying a transgene-encoding NOVX protein can further be bred to other transgenic animals carrying other transgenes.

30 To create a homologous recombinant animal, a vector is prepared which contains at least a portion of an NOVX gene into which a deletion, addition or substitution has been introduced to thereby alter, *e.g.*, functionally disrupt, the NOVX gene. The NOVX gene can be a human gene (*e.g.*, the cDNA of SEQ ID NOS:2n-1, wherein n is an integer between 1 and

162), but more preferably, is a non-human homologue of a human NOVX gene. For example, a mouse homologue of human NOVX gene of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 can be used to construct a homologous recombination vector suitable for altering an endogenous NOVX gene in the mouse genome. In one embodiment, the vector is  
5 designed such that, upon homologous recombination, the endogenous NOVX gene is functionally disrupted (*i.e.*, no longer encodes a functional protein; also referred to as a "knock out" vector).

Alternatively, the vector can be designed such that, upon homologous recombination, the endogenous NOVX gene is mutated or otherwise altered but still encodes functional  
10 protein (*e.g.*, the upstream regulatory region can be altered to thereby alter the expression of the endogenous NOVX protein). In the homologous recombination vector, the altered portion of the NOVX gene is flanked at its 5'- and 3'-termini by additional nucleic acid of the NOVX gene to allow for homologous recombination to occur between the exogenous NOVX gene carried by the vector and an endogenous NOVX gene in an embryonic stem cell. The  
15 additional flanking NOVX nucleic acid is of sufficient length for successful homologous recombination with the endogenous gene. Typically, several kilobases of flanking DNA (both at the 5'- and 3'-termini) are included in the vector. *See, e.g.*, Thomas, *et al.*, 1987. *Cell* 51: 503 for a description of homologous recombination vectors. The vector is then introduced into an embryonic stem cell line (*e.g.*, by electroporation) and cells in which the introduced NOVX  
20 gene has homologously-recombined with the endogenous NOVX gene are selected. *See, e.g.*, Li, *et al.*, 1992. *Cell* 69: 915.

The selected cells are then injected into a blastocyst of an animal (*e.g.*, a mouse) to form aggregation chimeras. *See, e.g.*, Bradley, 1987. In: TERATOCARCINOMAS AND EMBRYONIC STEM CELLS: A PRACTICAL APPROACH, Robertson, ed. IRL, Oxford, pp. 113-152.  
25 A chimeric embryo can then be implanted into a suitable pseudopregnant female foster animal and the embryo brought to term. Progeny harboring the homologously-recombined DNA in their germ cells can be used to breed animals in which all cells of the animal contain the homologously-recombined DNA by germline transmission of the transgene. Methods for constructing homologous recombination vectors and homologous recombinant animals are  
30 described further in Bradley, 1991. *Curr. Opin. Biotechnol.* 2: 823-829; PCT International Publication Nos.: WO 90/11354; WO 91/01140; WO 92/0968; and WO 93/04169.

In another embodiment, transgenic non-humans animals can be produced that contain selected systems that allow for regulated expression of the transgene. One example of such a system is the cre/loxP recombinase system of bacteriophage P1. For a description of the

cre/loxP recombinase system, *See, e.g., Lakso, et al., 1992. Proc. Natl. Acad. Sci. USA* 89: 6232-6236. Another example of a recombinase system is the FLP recombinase system of *Saccharomyces cerevisiae*. *See, O'Gorman, et al., 1991. Science* 251:1351-1355. If a cre/loxP recombinase system is used to regulate expression of the transgene, animals containing  
5 transgenes encoding both the Cre recombinase and a selected protein are required. Such animals can be provided through the construction of "double" transgenic animals, *e.g.,* by mating two transgenic animals, one containing a transgene encoding a selected protein and the other containing a transgene encoding a recombinase.

Clones of the non-human transgenic animals described herein can also be produced  
10 according to the methods described in Wilmut, *et al., 1997. Nature* 385: 810-813. In brief, a cell (*e.g.,* a somatic cell) from the transgenic animal can be isolated and induced to exit the growth cycle and enter G<sub>0</sub> phase. The quiescent cell can then be fused, *e.g.,* through the use of electrical pulses, to an enucleated oocyte from an animal of the same species from which the quiescent cell is isolated. The reconstructed oocyte is then cultured such that it develops to  
15 morula or blastocyte and then transferred to pseudopregnant female foster animal. The offspring borne of this female foster animal will be a clone of the animal from which the cell (*e.g.,* the somatic cell) is isolated.

### Pharmaceutical Compositions

The NOVX nucleic acid molecules, NOVX proteins, and anti-NOVX antibodies (also  
20 referred to herein as "active compounds") of the invention, and derivatives, fragments, analogs and homologs thereof, can be incorporated into pharmaceutical compositions suitable for administration. Such compositions typically comprise the nucleic acid molecule, protein, or antibody and a pharmaceutically acceptable carrier. As used herein, "pharmaceutically acceptable carrier" is intended to include any and all solvents, dispersion media, coatings,  
25 antibacterial and antifungal agents, isotonic and absorption delaying agents, and the like, compatible with pharmaceutical administration. Suitable carriers are described in the most recent edition of Remington's Pharmaceutical Sciences, a standard reference text in the field, which is incorporated herein by reference. Preferred examples of such carriers or diluents include, but are not limited to, water, saline, finger's solutions, dextrose solution, and 5%  
30 human serum albumin. Liposomes and non-aqueous vehicles such as fixed oils may also be used. The use of such media and agents for pharmaceutically active substances is well known in the art. Except insofar as any conventional media or agent is incompatible with the active

compound, use thereof in the compositions is contemplated. Supplementary active compounds can also be incorporated into the compositions.

A pharmaceutical composition of the invention is formulated to be compatible with its intended route of administration. Examples of routes of administration include parenteral, 5 *e.g.*, intravenous, intradermal, subcutaneous, oral (*e.g.*, inhalation), transdermal (*i.e.*, topical), transmucosal, and rectal administration. Solutions or suspensions used for parenteral, intradermal, or subcutaneous application can include the following components: a sterile diluent such as water for injection, saline solution, fixed oils, polyethylene glycols, glycerine, propylene glycol or other synthetic solvents; antibacterial agents such as benzyl alcohol or 10 methyl parabens; antioxidants such as ascorbic acid or sodium bisulfite; chelating agents such as ethylenediaminetetraacetic acid (EDTA); buffers such as acetates, citrates or phosphates, and agents for the adjustment of tonicity such as sodium chloride or dextrose. The pH can be adjusted with acids or bases, such as hydrochloric acid or sodium hydroxide. The parenteral preparation can be enclosed in ampoules, disposable syringes or multiple dose vials made of 15 glass or plastic.

Pharmaceutical compositions suitable for injectable use include sterile aqueous solutions (where water soluble) or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersion. For intravenous administration, suitable carriers include physiological saline, bacteriostatic water, Cremophor EL™ (BASF, 20 Parsippany, N.J.) or phosphate buffered saline (PBS). In all cases, the composition must be sterile and should be fluid to the extent that easy syringeability exists. It must be stable under the conditions of manufacture and storage and must be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (for example, glycerol, 25 propylene glycol, and liquid polyethylene glycol, and the like), and suitable mixtures thereof. The proper fluidity can be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersion and by the use of surfactants. Prevention of the action of microorganisms can be achieved by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, ascorbic 30 acid, thimerosal, and the like. In many cases, it will be preferable to include isotonic agents, for example, sugars, polyalcohols such as manitol, sorbitol, sodium chloride in the composition. Prolonged absorption of the injectable compositions can be brought about by including in the composition an agent which delays absorption, for example, aluminum monostearate and gelatin.

Sterile injectable solutions can be prepared by incorporating the active compound (*e.g.*, an NOVX protein or anti-NOVX antibody) in the required amount in an appropriate solvent with one or a combination of ingredients enumerated above, as required, followed by filtered sterilization. Generally, dispersions are prepared by incorporating the active compound into a sterile vehicle that contains a basic dispersion medium and the required other ingredients from those enumerated above. In the case of sterile powders for the preparation of sterile injectable solutions, methods of preparation are vacuum drying and freeze-drying that yields a powder of the active ingredient plus any additional desired ingredient from a previously sterile-filtered solution thereof.

Oral compositions generally include an inert diluent or an edible carrier. They can be enclosed in gelatin capsules or compressed into tablets. For the purpose of oral therapeutic administration, the active compound can be incorporated with excipients and used in the form of tablets, troches, or capsules. Oral compositions can also be prepared using a fluid carrier for use as a mouthwash, wherein the compound in the fluid carrier is applied orally and swished and expectorated or swallowed. Pharmaceutically compatible binding agents, and/or adjuvant materials can be included as part of the composition. The tablets, pills, capsules, troches and the like can contain any of the following ingredients, or compounds of a similar nature: a binder such as microcrystalline cellulose, gum tragacanth or gelatin; an excipient such as starch or lactose, a disintegrating agent such as alginic acid, Primogel, or corn starch; a lubricant such as magnesium stearate or Sterotes; a glidant such as colloidal silicon dioxide; a sweetening agent such as sucrose or saccharin; or a flavoring agent such as peppermint, methyl salicylate, or orange flavoring.

For administration by inhalation, the compounds are delivered in the form of an aerosol spray from pressured container or dispenser which contains a suitable propellant, *e.g.*, a gas such as carbon dioxide, or a nebulizer.

Systemic administration can also be by transmucosal or transdermal means. For transmucosal or transdermal administration, penetrants appropriate to the barrier to be permeated are used in the formulation. Such penetrants are generally known in the art, and include, for example, for transmucosal administration, detergents, bile salts, and fusidic acid derivatives. Transmucosal administration can be accomplished through the use of nasal sprays or suppositories. For transdermal administration, the active compounds are formulated into ointments, salves, gels, or creams as generally known in the art.

The compounds can also be prepared in the form of suppositories (*e.g.*, with conventional suppository bases such as cocoa butter and other glycerides) or retention enemas for rectal delivery.

5 In one embodiment, the active compounds are prepared with carriers that will protect the compound against rapid elimination from the body, such as a controlled release formulation, including implants and microencapsulated delivery systems. Biodegradable, biocompatible polymers can be used, such as ethylene vinyl acetate, polyanhydrides, polyglycolic acid, collagen, polyorthoesters, and polylactic acid. Methods for preparation of such formulations will be apparent to those skilled in the art. The materials can also be  
10 obtained commercially from Alza Corporation and Nova Pharmaceuticals, Inc. Liposomal suspensions (including liposomes targeted to infected cells with monoclonal antibodies to viral antigens) can also be used as pharmaceutically acceptable carriers. These can be prepared according to methods known to those skilled in the art, for example, as described in U.S. Patent No. 4,522,811.

15 It is especially advantageous to formulate oral or parenteral compositions in dosage unit form for ease of administration and uniformity of dosage. Dosage unit form as used herein refers to physically discrete units suited as unitary dosages for the subject to be treated; each unit containing a predetermined quantity of active compound calculated to produce the desired therapeutic effect in association with the required pharmaceutical carrier. The  
20 specification for the dosage unit forms of the invention are dictated by and directly dependent on the unique characteristics of the active compound and the particular therapeutic effect to be achieved, and the limitations inherent in the art of compounding such an active compound for the treatment of individuals.

The nucleic acid molecules of the invention can be inserted into vectors and used as  
25 gene therapy vectors. Gene therapy vectors can be delivered to a subject by, for example, intravenous injection, local administration (*see, e.g.*, U.S. Patent No. 5,328,470) or by stereotactic injection (*see, e.g.*, Chen, *et al.*, 1994. *Proc. Natl. Acad. Sci. USA* 91: 3054-3057). The pharmaceutical preparation of the gene therapy vector can include the gene therapy vector in an acceptable diluent, or can comprise a slow release matrix in which the gene delivery  
30 vehicle is imbedded. Alternatively, where the complete gene delivery vector can be produced intact from recombinant cells, *e.g.*, retroviral vectors, the pharmaceutical preparation can include one or more cells that produce the gene delivery system.

The pharmaceutical compositions can be included in a container, pack, or dispenser together with instructions for administration.

### Screening and Detection Methods

The isolated nucleic acid molecules of the invention can be used to express NOVX protein (*e.g.*, via a recombinant expression vector in a host cell in gene therapy applications), to detect NOVX mRNA (*e.g.*, in a biological sample) or a genetic lesion in an NOVX gene, and to modulate NOVX activity, as described further, below. In addition, the NOVX proteins can be used to screen drugs or compounds that modulate the NOVX protein activity or expression as well as to treat disorders characterized by insufficient or excessive production of NOVX protein or production of NOVX protein forms that have decreased or aberrant activity compared to NOVX wild-type protein (*e.g.*; diabetes (regulates insulin release); obesity (binds and transport lipids); metabolic disturbances associated with obesity, the metabolic syndrome X as well as anorexia and wasting disorders associated with chronic diseases and various cancers, and infectious disease (possesses anti-microbial activity) and the various dyslipidemias. In addition, the anti-NOVX antibodies of the invention can be used to detect and isolate NOVX proteins and modulate NOVX activity. In yet a further aspect, the invention can be used in methods to influence appetite, absorption of nutrients and the disposition of metabolic substrates in both a positive and negative fashion.

The invention further pertains to novel agents identified by the screening assays described herein and uses thereof for treatments as described, *supra*.

### Screening Assays

The invention provides a method (also referred to herein as a "screening assay") for identifying modulators, *i.e.*, candidate or test compounds or agents (*e.g.*, peptides, peptidomimetics, small molecules or other drugs) that bind to NOVX proteins or have a stimulatory or inhibitory effect on, *e.g.*, NOVX protein expression or NOVX protein activity. The invention also includes compounds identified in the screening assays described herein.

In one embodiment, the invention provides assays for screening candidate or test compounds which bind to or modulate the activity of the membrane-bound form of an NOVX protein or polypeptide or biologically-active portion thereof. The test compounds of the invention can be obtained using any of the numerous approaches in combinatorial library methods known in the art, including: biological libraries; spatially addressable parallel solid phase or solution phase libraries; synthetic library methods requiring deconvolution; the "one-bead one-compound" library method; and synthetic library methods using affinity chromatography selection. The biological library approach is limited to peptide libraries,

while the other four approaches are applicable to peptide, non-peptide oligomer or small molecule libraries of compounds. See, e.g., Lam, 1997. *Anticancer Drug Design* 12: 145.

A "small molecule" as used herein, is meant to refer to a composition that has a molecular weight of less than about 5 kD and most preferably less than about 4 kD. Small molecules can be, e.g., nucleic acids, peptides, polypeptides, peptidomimetics, carbohydrates, lipids or other organic or inorganic molecules. Libraries of chemical and/or biological mixtures, such as fungal, bacterial, or algal extracts, are known in the art and can be screened with any of the assays of the invention.

Examples of methods for the synthesis of molecular libraries can be found in the art, for example in: DeWitt, *et al.*, 1993. *Proc. Natl. Acad. Sci. U.S.A.* 90: 6909; Erb, *et al.*, 1994. *Proc. Natl. Acad. Sci. U.S.A.* 91: 11422; Zuckermann, *et al.*, 1994. *J. Med. Chem.* 37: 2678; Cho, *et al.*, 1993. *Science* 261: 1303; Carrell, *et al.*, 1994. *Angew. Chem. Int. Ed. Engl.* 33: 2059; Carrell, *et al.*, 1994. *Angew. Chem. Int. Ed. Engl.* 33: 2061; and Gallop, *et al.*, 1994. *J. Med. Chem.* 37: 1233.

Libraries of compounds may be presented in solution (e.g., Houghten, 1992. *Biotechniques* 13: 412-421), or on beads (Lam, 1991. *Nature* 354: 82-84), on chips (Fodor, 1993. *Nature* 364: 555-556), bacteria (Ladner, U.S. Patent No. 5,223,409), spores (Ladner, U.S. Patent 5,233,409), plasmids (Cull, *et al.*, 1992. *Proc. Natl. Acad. Sci. USA* 89: 1865-1869) or on phage (Scott and Smith, 1990. *Science* 249: 386-390; Devlin, 1990. *Science* 249: 404-406; Cwirla, *et al.*, 1990. *Proc. Natl. Acad. Sci. U.S.A.* 87: 6378-6382; Felici, 1991. *J. Mol. Biol.* 222: 301-310; Ladner, U.S. Patent No. 5,233,409.).

In one embodiment, an assay is a cell-based assay in which a cell which expresses a membrane-bound form of NOVX protein, or a biologically-active portion thereof, on the cell surface is contacted with a test compound and the ability of the test compound to bind to an NOVX protein determined. The cell, for example, can be of mammalian origin or a yeast cell. Determining the ability of the test compound to bind to the NOVX protein can be accomplished, for example, by coupling the test compound with a radioisotope or enzymatic label such that binding of the test compound to the NOVX protein or biologically-active portion thereof can be determined by detecting the labeled compound in a complex. For example, test compounds can be labeled with  $^{125}\text{I}$ ,  $^{35}\text{S}$ ,  $^{14}\text{C}$ , or  $^3\text{H}$ , either directly or indirectly, and the radioisotope detected by direct counting of radioemission or by scintillation counting. Alternatively, test compounds can be enzymatically-labeled with, for example, horseradish peroxidase, alkaline phosphatase, or luciferase, and the enzymatic label detected by determination of conversion of an appropriate substrate to product. In one embodiment, the

assay comprises contacting a cell which expresses a membrane-bound form of NOVX protein, or a biologically-active portion thereof, on the cell surface with a known compound which binds NOVX to form an assay mixture, contacting the assay mixture with a test compound, and determining the ability of the test compound to interact with an NOVX protein, wherein  
5 determining the ability of the test compound to interact with an NOVX protein comprises determining the ability of the test compound to preferentially bind to NOVX protein or a biologically-active portion thereof as compared to the known compound.

In another embodiment, an assay is a cell-based assay comprising contacting a cell expressing a membrane-bound form of NOVX protein, or a biologically-active portion thereof,  
10 on the cell surface with a test compound and determining the ability of the test compound to modulate (*e.g.*, stimulate or inhibit) the activity of the NOVX protein or biologically-active portion thereof. Determining the ability of the test compound to modulate the activity of NOVX or a biologically-active portion thereof can be accomplished, for example, by determining the ability of the NOVX protein to bind to or interact with an NOVX target  
15 molecule. As used herein, a "target molecule" is a molecule with which an NOVX protein binds or interacts in nature, for example, a molecule on the surface of a cell which expresses an NOVX interacting protein, a molecule on the surface of a second cell, a molecule in the extracellular milieu, a molecule associated with the internal surface of a cell membrane or a cytoplasmic molecule. An NOVX target molecule can be a non-NOVX molecule or an  
20 NOVX protein or polypeptide of the invention. In one embodiment, an NOVX target molecule is a component of a signal transduction pathway that facilitates transduction of an extracellular signal (*e.g.* a signal generated by binding of a compound to a membrane-bound NOVX molecule) through the cell membrane and into the cell. The target, for example, can be a second intercellular protein that has catalytic activity or a protein that facilitates the  
25 association of downstream signaling molecules with NOVX.

Determining the ability of the NOVX protein to bind to or interact with an NOVX target molecule can be accomplished by one of the methods described above for determining direct binding. In one embodiment, determining the ability of the NOVX protein to bind to or interact with an NOVX target molecule can be accomplished by determining the activity of the  
30 target molecule. For example, the activity of the target molecule can be determined by detecting induction of a cellular second messenger of the target (*i.e.* intracellular  $\text{Ca}^{2+}$ , diacylglycerol,  $\text{IP}_3$ , etc.), detecting catalytic/enzymatic activity of the target on an appropriate substrate, detecting the induction of a reporter gene (comprising an NOVX-responsive regulatory element operatively linked to a nucleic acid encoding a detectable marker, *e.g.*,

luciferase), or detecting a cellular response, for example, cell survival, cellular differentiation, or cell proliferation.

In yet another embodiment, an assay of the invention is a cell-free assay comprising contacting an NOVX protein or biologically-active portion thereof with a test compound and  
5 determining the ability of the test compound to bind to the NOVX protein or biologically-active portion thereof. Binding of the test compound to the NOVX protein can be determined either directly or indirectly as described above. In one such embodiment, the assay comprises contacting the NOVX protein or biologically-active portion thereof with a known compound which binds NOVX to form an assay mixture, contacting the assay mixture with a test  
10 compound, and determining the ability of the test compound to interact with an NOVX protein, wherein determining the ability of the test compound to interact with an NOVX protein comprises determining the ability of the test compound to preferentially bind to NOVX or biologically-active portion thereof as compared to the known compound.

In still another embodiment, an assay is a cell-free assay comprising contacting NOVX  
15 protein or biologically-active portion thereof with a test compound and determining the ability of the test compound to modulate (*e.g.* stimulate or inhibit) the activity of the NOVX protein or biologically-active portion thereof. Determining the ability of the test compound to modulate the activity of NOVX can be accomplished, for example, by determining the ability of the NOVX protein to bind to an NOVX target molecule by one of the methods described  
20 above for determining direct binding. In an alternative embodiment, determining the ability of the test compound to modulate the activity of NOVX protein can be accomplished by determining the ability of the NOVX protein further modulate an NOVX target molecule. For example, the catalytic/enzymatic activity of the target molecule on an appropriate substrate can be determined as described, *supra*.

25 In yet another embodiment, the cell-free assay comprises contacting the NOVX protein or biologically-active portion thereof with a known compound which binds NOVX protein to form an assay mixture, contacting the assay mixture with a test compound, and determining the ability of the test compound to interact with an NOVX protein, wherein determining the ability of the test compound to interact with an NOVX protein comprises determining the  
30 ability of the NOVX protein to preferentially bind to or modulate the activity of an NOVX target molecule.

The cell-free assays of the invention are amenable to use of both the soluble form or the membrane-bound form of NOVX protein. In the case of cell-free assays comprising the membrane-bound form of NOVX protein, it may be desirable to utilize a solubilizing agent

such that the membrane-bound form of NOVX protein is maintained in solution. Examples of such solubilizing agents include non-ionic detergents such as n-octylglucoside, n-dodecylglucoside, n-dodecylmaltoside, octanoyl-N-methylglucamide, decanoyl-N-methylglucamide, Triton<sup>®</sup> X-100, Triton<sup>®</sup> X-114, Thesit<sup>®</sup>,  
5 Isotridecypoly(ethylene glycol ether)<sub>n</sub>, N-dodecyl--N,N-dimethyl-3-ammonio-1-propane sulfonate, 3-(3-cholamidopropyl) dimethylamminiol-1-propane sulfonate (CHAPS), or 3-(3-cholamidopropyl)dimethylamminiol-2-hydroxy-1-propane sulfonate (CHAPSO).

In more than one embodiment of the above assay methods of the invention, it may be desirable to immobilize either NOVX protein or its target molecule to facilitate separation of  
10 complexed from uncomplexed forms of one or both of the proteins, as well as to accommodate automation of the assay. Binding of a test compound to NOVX protein, or interaction of NOVX protein with a target molecule in the presence and absence of a candidate compound, can be accomplished in any vessel suitable for containing the reactants. Examples of such vessels include microtiter plates, test tubes, and micro-centrifuge tubes. In one embodiment, a  
15 fusion protein can be provided that adds a domain that allows one or both of the proteins to be bound to a matrix. For example, GST-NOVX fusion proteins or GST-target fusion proteins can be adsorbed onto glutathione sepharose beads (Sigma Chemical, St. Louis, MO) or glutathione derivatized microtiter plates, that are then combined with the test compound or the test compound and either the non-adsorbed target protein or NOVX protein, and the mixture is  
20 incubated under conditions conducive to complex formation (*e.g.*, at physiological conditions for salt and pH). Following incubation, the beads or microtiter plate wells are washed to remove any unbound components, the matrix immobilized in the case of beads, complex determined either directly or indirectly, for example, as described, *supra*. Alternatively, the complexes can be dissociated from the matrix, and the level of NOVX protein binding or  
25 activity determined using standard techniques.

Other techniques for immobilizing proteins on matrices can also be used in the screening assays of the invention. For example, either the NOVX protein or its target molecule can be immobilized utilizing conjugation of biotin and streptavidin. Biotinylated NOVX protein or target molecules can be prepared from biotin-NHS  
30 (N-hydroxy-succinimide) using techniques well-known within the art (*e.g.*, biotinylation kit, Pierce Chemicals, Rockford, Ill.), and immobilized in the wells of streptavidin-coated 96 well plates (Pierce Chemical). Alternatively, antibodies reactive with NOVX protein or target molecules, but which do not interfere with binding of the NOVX protein to its target molecule, can be derivatized to the wells of the plate, and unbound target or NOVX protein trapped in

the wells by antibody conjugation. Methods for detecting such complexes, in addition to those described above for the GST-immobilized complexes, include immunodetection of complexes using antibodies reactive with the NOVX protein or target molecule, as well as enzyme-linked assays that rely on detecting an enzymatic activity associated with the NOVX protein or target molecule.

In another embodiment, modulators of NOVX protein expression are identified in a method wherein a cell is contacted with a candidate compound and the expression of NOVX mRNA or protein in the cell is determined. The level of expression of NOVX mRNA or protein in the presence of the candidate compound is compared to the level of expression of NOVX mRNA or protein in the absence of the candidate compound. The candidate compound can then be identified as a modulator of NOVX mRNA or protein expression based upon this comparison. For example, when expression of NOVX mRNA or protein is greater (*i.e.*, statistically significantly greater) in the presence of the candidate compound than in its absence, the candidate compound is identified as a stimulator of NOVX mRNA or protein expression. Alternatively, when expression of NOVX mRNA or protein is less (statistically significantly less) in the presence of the candidate compound than in its absence, the candidate compound is identified as an inhibitor of NOVX mRNA or protein expression. The level of NOVX mRNA or protein expression in the cells can be determined by methods described herein for detecting NOVX mRNA or protein.

In yet another aspect of the invention, the NOVX proteins can be used as "bait proteins" in a two-hybrid assay or three hybrid assay (*see, e.g.*, U.S. Patent No. 5,283,317; Zervos, *et al.*, 1993. *Cell* 72: 223-232; Madura, *et al.*, 1993. *J. Biol. Chem.* 268: 12046-12054; Bartel, *et al.*, 1993. *Biotechniques* 14: 920-924; Iwabuchi, *et al.*, 1993. *Oncogene* 8: 1693-1696; and Brent WO 94/10300), to identify other proteins that bind to or interact with NOVX ("NOVX-binding proteins" or "NOVX-bp") and modulate NOVX activity. Such NOVX-binding proteins are also likely to be involved in the propagation of signals by the NOVX proteins as, for example, upstream or downstream elements of the NOVX pathway.

The two-hybrid system is based on the modular nature of most transcription factors, which consist of separable DNA-binding and activation domains. Briefly, the assay utilizes two different DNA constructs. In one construct, the gene that codes for NOVX is fused to a gene encoding the DNA binding domain of a known transcription factor (*e.g.*, GAL-4). In the other construct, a DNA sequence, from a library of DNA sequences, that encodes an unidentified protein ("prey" or "sample") is fused to a gene that codes for the activation domain of the known transcription factor. If the "bait" and the "prey" proteins are able to

interact, *in vivo*, forming an NOVX-dependent complex, the DNA-binding and activation domains of the transcription factor are brought into close proximity. This proximity allows transcription of a reporter gene (*e.g.*, LacZ) that is operably linked to a transcriptional regulatory site responsive to the transcription factor. Expression of the reporter gene can be detected and cell colonies containing the functional transcription factor can be isolated and used to obtain the cloned gene that encodes the protein which interacts with NOVX.

The invention further pertains to novel agents identified by the aforementioned screening assays and uses thereof for treatments as described herein.

### Detection Assays

Portions or fragments of the cDNA sequences identified herein (and the corresponding complete gene sequences) can be used in numerous ways as polynucleotide reagents. By way of example, and not of limitation, these sequences can be used to: (i) map their respective genes on a chromosome; and, thus, locate gene regions associated with genetic disease; (ii) identify an individual from a minute biological sample (tissue typing); and (iii) aid in forensic identification of a biological sample. Some of these applications are described in the subsections, below.

### Chromosome Mapping

Once the sequence (or a portion of the sequence) of a gene has been isolated, this sequence can be used to map the location of the gene on a chromosome. This process is called chromosome mapping. Accordingly, portions or fragments of the NOVX sequences, SEQ ID NOS:2n-1, wherein *n* is an integer between 1 and 162, or fragments or derivatives thereof, can be used to map the location of the NOVX genes, respectively, on a chromosome. The mapping of the NOVX sequences to chromosomes is an important first step in correlating these sequences with genes associated with disease.

Briefly, NOVX genes can be mapped to chromosomes by preparing PCR primers (preferably 15-25 bp in length) from the NOVX sequences. Computer analysis of the NOVX sequences can be used to rapidly select primers that do not span more than one exon in the genomic DNA, thus complicating the amplification process. These primers can then be used for PCR screening of somatic cell hybrids containing individual human chromosomes. Only those hybrids containing the human gene corresponding to the NOVX sequences will yield an amplified fragment.

Somatic cell hybrids are prepared by fusing somatic cells from different mammals (e.g., human and mouse cells). As hybrids of human and mouse cells grow and divide, they gradually lose human chromosomes in random order, but retain the mouse chromosomes. By using media in which mouse cells cannot grow, because they lack a particular enzyme, but in which human cells can, the one human chromosome that contains the gene encoding the needed enzyme will be retained. By using various media, panels of hybrid cell lines can be established. Each cell line in a panel contains either a single human chromosome or a small number of human chromosomes, and a full set of mouse chromosomes, allowing easy mapping of individual genes to specific human chromosomes. *See, e.g., D'Eustachio, et al.,* 1983. *Science* 220: 919-924. Somatic cell hybrids containing only fragments of human chromosomes can also be produced by using human chromosomes with translocations and deletions.

PCR mapping of somatic cell hybrids is a rapid procedure for assigning a particular sequence to a particular chromosome. Three or more sequences can be assigned per day using a single thermal cycler. Using the NOVX sequences to design oligonucleotide primers, sub-localization can be achieved with panels of fragments from specific chromosomes.

Fluorescence *in situ* hybridization (FISH) of a DNA sequence to a metaphase chromosomal spread can further be used to provide a precise chromosomal location in one step. Chromosome spreads can be made using cells whose division has been blocked in metaphase by a chemical like colcemid that disrupts the mitotic spindle. The chromosomes can be treated briefly with trypsin, and then stained with Giemsa. A pattern of light and dark bands develops on each chromosome, so that the chromosomes can be identified individually. The FISH technique can be used with a DNA sequence as short as 500 or 600 bases. However, clones larger than 1,000 bases have a higher likelihood of binding to a unique chromosomal location with sufficient signal intensity for simple detection. Preferably 1,000 bases, and more preferably 2,000 bases, will suffice to get good results at a reasonable amount of time. For a review of this technique, *see, Verma, et al., HUMAN CHROMOSOMES: A MANUAL OF BASIC TECHNIQUES* (Pergamon Press, New York 1988).

Reagents for chromosome mapping can be used individually to mark a single chromosome or a single site on that chromosome, or panels of reagents can be used for marking multiple sites and/or multiple chromosomes. Reagents corresponding to noncoding regions of the genes actually are preferred for mapping purposes. Coding sequences are more likely to be conserved within gene families, thus increasing the chance of cross hybridizations during chromosomal mapping.

Once a sequence has been mapped to a precise chromosomal location, the physical position of the sequence on the chromosome can be correlated with genetic map data. Such data are found, *e.g.*, in McKusick, MENDELIAN INHERITANCE IN MAN, available on-line through Johns Hopkins University Welch Medical Library). The relationship between genes  
5 and disease, mapped to the same chromosomal region, can then be identified through linkage analysis (co-inheritance of physically adjacent genes), described in, *e.g.*, Egeland, *et al.*, 1987. *Nature*, 325: 783-787.

Moreover, differences in the DNA sequences between individuals affected and unaffected with a disease associated with the NOVX gene, can be determined. If a mutation is  
10 observed in some or all of the affected individuals but not in any unaffected individuals, then the mutation is likely to be the causative agent of the particular disease. Comparison of affected and unaffected individuals generally involves first looking for structural alterations in the chromosomes, such as deletions or translocations that are visible from chromosome spreads or detectable using PCR based on that DNA sequence. Ultimately, complete  
15 sequencing of genes from several individuals can be performed to confirm the presence of a mutation and to distinguish mutations from polymorphisms.

### Tissue Typing

The NOVX sequences of the invention can also be used to identify individuals from  
20 minute biological samples. In this technique, an individual's genomic DNA is digested with one or more restriction enzymes, and probed on a Southern blot to yield unique bands for identification. The sequences of the invention are useful as additional DNA markers for RFLP ("restriction fragment length polymorphisms," described in U.S. Patent No. 5,272,057).

Furthermore, the sequences of the invention can be used to provide an alternative  
25 technique that determines the actual base-by-base DNA sequence of selected portions of an individual's genome. Thus, the NOVX sequences described herein can be used to prepare two PCR primers from the 5'- and 3'-termini of the sequences. These primers can then be used to amplify an individual's DNA and subsequently sequence it.

Panels of corresponding DNA sequences from individuals, prepared in this manner,  
30 can provide unique individual identifications, as each individual will have a unique set of such DNA sequences due to allelic differences. The sequences of the invention can be used to obtain such identification sequences from individuals and from tissue. The NOVX sequences of the invention uniquely represent portions of the human genome. Allelic variation occurs to some degree in the coding regions of these sequences, and to a greater degree in the noncoding

regions. It is estimated that allelic variation between individual humans occurs with a frequency of about once per each 500 bases. Much of the allelic variation is due to single nucleotide polymorphisms (SNPs), which include restriction fragment length polymorphisms (RFLPs).

5 Each of the sequences described herein can, to some degree, be used as a standard against which DNA from an individual can be compared for identification purposes. Because greater numbers of polymorphisms occur in the noncoding regions, fewer sequences are necessary to differentiate individuals. The noncoding sequences can comfortably provide positive individual identification with a panel of perhaps 10 to 1,000 primers that each yield a  
10 noncoding amplified sequence of 100 bases. If predicted coding sequences, such as those in SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162 are used, a more appropriate number of primers for positive individual identification would be 500-2,000.

#### Predictive Medicine

15 The invention also pertains to the field of predictive medicine in which diagnostic assays, prognostic assays, pharmacogenomics, and monitoring clinical trials are used for prognostic (predictive) purposes to thereby treat an individual prophylactically. Accordingly, one aspect of the invention relates to diagnostic assays for determining NOVX protein and/or nucleic acid expression as well as NOVX activity, in the context of a biological sample (e.g.,  
20 blood, serum, cells, tissue) to thereby determine whether an individual is afflicted with a disease or disorder, or is at risk of developing a disorder, associated with aberrant NOVX expression or activity. The disorders include metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, and hematopoietic disorders,  
25 and the various dyslipidemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers. The invention also provides for prognostic (or predictive) assays for determining whether an individual is at risk of developing a disorder associated with NOVX protein, nucleic acid expression or activity. For example, mutations in an NOVX gene can be assayed in a  
30 biological sample. Such assays can be used for prognostic or predictive purpose to thereby prophylactically treat an individual prior to the onset of a disorder characterized by or associated with NOVX protein, nucleic acid expression, or biological activity.

Another aspect of the invention provides methods for determining NOVX protein, nucleic acid expression or activity in an individual to thereby select appropriate therapeutic or

prophylactic agents for that individual (referred to herein as "pharmacogenomics"). Pharmacogenomics allows for the selection of agents (*e.g.*, drugs) for therapeutic or prophylactic treatment of an individual based on the genotype of the individual (*e.g.*, the genotype of the individual examined to determine the ability of the individual to respond to a particular agent.)

Yet another aspect of the invention pertains to monitoring the influence of agents (*e.g.*, drugs, compounds) on the expression or activity of NOVX in clinical trials.

These and other agents are described in further detail in the following sections.

### Diagnostic Assays

An exemplary method for detecting the presence or absence of NOVX in a biological sample involves obtaining a biological sample from a test subject and contacting the biological sample with a compound or an agent capable of detecting NOVX protein or nucleic acid (*e.g.*, mRNA, genomic DNA) that encodes NOVX protein such that the presence of NOVX is detected in the biological sample. An agent for detecting NOVX mRNA or genomic DNA is a labeled nucleic acid probe capable of hybridizing to NOVX mRNA or genomic DNA. The nucleic acid probe can be, for example, a full-length NOVX nucleic acid, such as the nucleic acid of SEQ ID NOS:2n-1, wherein *n* is an integer between 1 and 162, or a portion thereof, such as an oligonucleotide of at least 15, 30, 50, 100, 250 or 500 nucleotides in length and sufficient to specifically hybridize under stringent conditions to NOVX mRNA or genomic DNA. Other suitable probes for use in the diagnostic assays of the invention are described herein.

An agent for detecting NOVX protein is an antibody capable of binding to NOVX protein, preferably an antibody with a detectable label. Antibodies can be polyclonal, or more preferably, monoclonal. An intact antibody, or a fragment thereof (*e.g.*, Fab or F(ab')<sub>2</sub>) can be used. The term "labeled", with regard to the probe or antibody, is intended to encompass direct labeling of the probe or antibody by coupling (*i.e.*, physically linking) a detectable substance to the probe or antibody, as well as indirect labeling of the probe or antibody by reactivity with another reagent that is directly labeled. Examples of indirect labeling include detection of a primary antibody using a fluorescently-labeled secondary antibody and end-labeling of a DNA probe with biotin such that it can be detected with fluorescently-labeled streptavidin. The term "biological sample" is intended to include tissues, cells and biological fluids isolated from a subject, as well as tissues, cells and fluids present within a subject. That is, the detection method of the invention can be used to detect NOVX mRNA,

protein, or genomic DNA in a biological sample *in vitro* as well as *in vivo*. For example, *in vitro* techniques for detection of NOVX mRNA include Northern hybridizations and *in situ* hybridizations. *In vitro* techniques for detection of NOVX protein include enzyme linked immunosorbent assays (ELISAs), Western blots, immunoprecipitations, and  
5 immunofluorescence. *In vitro* techniques for detection of NOVX genomic DNA include Southern hybridizations. Furthermore, *in vivo* techniques for detection of NOVX protein include introducing into a subject a labeled anti-NOVX antibody. For example, the antibody can be labeled with a radioactive marker whose presence and location in a subject can be detected by standard imaging techniques.

10 In one embodiment, the biological sample contains protein molecules from the test subject. Alternatively, the biological sample can contain mRNA molecules from the test subject or genomic DNA molecules from the test subject. A preferred biological sample is a peripheral blood leukocyte sample isolated by conventional means from a subject.

In another embodiment, the methods further involve obtaining a control biological  
15 sample from a control subject, contacting the control sample with a compound or agent capable of detecting NOVX protein, mRNA, or genomic DNA, such that the presence of NOVX protein, mRNA or genomic DNA is detected in the biological sample, and comparing the presence of NOVX protein, mRNA or genomic DNA in the control sample with the presence of NOVX protein, mRNA or genomic DNA in the test sample.

20 The invention also encompasses kits for detecting the presence of NOVX in a biological sample. For example, the kit can comprise: a labeled compound or agent capable of detecting NOVX protein or mRNA in a biological sample; means for determining the amount of NOVX in the sample; and means for comparing the amount of NOVX in the sample with a standard. The compound or agent can be packaged in a suitable container. The kit can further  
25 comprise instructions for using the kit to detect NOVX protein or nucleic acid.

### Prognostic Assays

The diagnostic methods described herein can furthermore be utilized to identify  
30 subjects having or at risk of developing a disease or disorder associated with aberrant NOVX expression or activity. For example, the assays described herein, such as the preceding diagnostic assays or the following assays, can be utilized to identify a subject having or at risk of developing a disorder associated with NOVX protein, nucleic acid expression or activity. Alternatively, the prognostic assays can be utilized to identify a subject having or at risk for developing a disease or disorder. Thus, the invention provides a method for identifying a

disease or disorder associated with aberrant NOVX expression or activity in which a test sample is obtained from a subject and NOVX protein or nucleic acid (*e.g.*, mRNA, genomic DNA) is detected, wherein the presence of NOVX protein or nucleic acid is diagnostic for a subject having or at risk of developing a disease or disorder associated with aberrant NOVX expression or activity. As used herein, a "test sample" refers to a biological sample obtained from a subject of interest. For example, a test sample can be a biological fluid (*e.g.*, serum), cell sample, or tissue.

Furthermore, the prognostic assays described herein can be used to determine whether a subject can be administered an agent (*e.g.*, an agonist, antagonist, peptidomimetic, protein, peptide, nucleic acid, small molecule, or other drug candidate) to treat a disease or disorder associated with aberrant NOVX expression or activity. For example, such methods can be used to determine whether a subject can be effectively treated with an agent for a disorder. Thus, the invention provides methods for determining whether a subject can be effectively treated with an agent for a disorder associated with aberrant NOVX expression or activity in which a test sample is obtained and NOVX protein or nucleic acid is detected (*e.g.*, wherein the presence of NOVX protein or nucleic acid is diagnostic for a subject that can be administered the agent to treat a disorder associated with aberrant NOVX expression or activity).

The methods of the invention can also be used to detect genetic lesions in an NOVX gene, thereby determining if a subject with the lesioned gene is at risk for a disorder characterized by aberrant cell proliferation and/or differentiation. In various embodiments, the methods include detecting, in a sample of cells from the subject, the presence or absence of a genetic lesion characterized by at least one of an alteration affecting the integrity of a gene encoding an NOVX-protein, or the misexpression of the NOVX gene. For example, such genetic lesions can be detected by ascertaining the existence of at least one of: (i) a deletion of one or more nucleotides from an NOVX gene; (ii) an addition of one or more nucleotides to an NOVX gene; (iii) a substitution of one or more nucleotides of an NOVX gene, (iv) a chromosomal rearrangement of an NOVX gene; (v) an alteration in the level of a messenger RNA transcript of an NOVX gene, (vi) aberrant modification of an NOVX gene, such as of the methylation pattern of the genomic DNA, (vii) the presence of a non-wild-type splicing pattern of a messenger RNA transcript of an NOVX gene, (viii) a non-wild-type level of an NOVX protein, (ix) allelic loss of an NOVX gene, and (x) inappropriate post-translational modification of an NOVX protein. As described herein, there are a large number of assay techniques known in the art which can be used for detecting lesions in an NOVX gene. A

preferred biological sample is a peripheral blood leukocyte sample isolated by conventional means from a subject. However, any biological sample containing nucleated cells may be used, including, for example, buccal mucosal cells.

In certain embodiments, detection of the lesion involves the use of a probe/primer in a polymerase chain reaction (PCR) (*see, e.g.*, U.S. Patent Nos. 4,683,195 and 4,683,202), such as anchor PCR or RACE PCR, or, alternatively, in a ligation chain reaction (LCR) (*see, e.g.*, Landegran, *et al.*, 1988. *Science* 241: 1077-1080; and Nakazawa, *et al.*, 1994. *Proc. Natl. Acad. Sci. USA* 91: 360-364), the latter of which can be particularly useful for detecting point mutations in the NOVX-gene (*see*, Abravaya, *et al.*, 1995. *Nucl. Acids Res.* 23: 675-682). This method can include the steps of collecting a sample of cells from a patient, isolating nucleic acid (*e.g.*, genomic, mRNA or both) from the cells of the sample, contacting the nucleic acid sample with one or more primers that specifically hybridize to an NOVX gene under conditions such that hybridization and amplification of the NOVX gene (if present) occurs, and detecting the presence or absence of an amplification product, or detecting the size of the amplification product and comparing the length to a control sample. It is anticipated that PCR and/or LCR may be desirable to use as a preliminary amplification step in conjunction with any of the techniques used for detecting mutations described herein.

Alternative amplification methods include: self sustained sequence replication (*see*, Guatelli, *et al.*, 1990. *Proc. Natl. Acad. Sci. USA* 87: 1874-1878), transcriptional amplification system (*see*, Kwok, *et al.*, 1989. *Proc. Natl. Acad. Sci. USA* 86: 1173-1177); Q $\beta$  Replicase (*see*, Lizardi, *et al.*, 1988. *BioTechnology* 6: 1197), or any other nucleic acid amplification method, followed by the detection of the amplified molecules using techniques well known to those of skill in the art. These detection schemes are especially useful for the detection of nucleic acid molecules if such molecules are present in very low numbers.

In an alternative embodiment, mutations in an NOVX gene from a sample cell can be identified by alterations in restriction enzyme cleavage patterns. For example, sample and control DNA is isolated, amplified (optionally), digested with one or more restriction endonucleases, and fragment length sizes are determined by gel electrophoresis and compared. Differences in fragment length sizes between sample and control DNA indicates mutations in the sample DNA. Moreover, the use of sequence specific ribozymes (*see, e.g.*, U.S. Patent No. 5,493,531) can be used to score for the presence of specific mutations by development or loss of a ribozyme cleavage site.

In other embodiments, genetic mutations in NOVX can be identified by hybridizing a sample and control nucleic acids, *e.g.*, DNA or RNA, to high-density arrays containing

hundreds or thousands of oligonucleotides probes. See, e.g., Cronin, *et al.*, 1996. *Human Mutation* 7: 244-255; Kozal, *et al.*, 1996. *Nat. Med.* 2: 753-759. For example, genetic mutations in NOVX can be identified in two dimensional arrays containing light-generated DNA probes as described in Cronin, *et al.*, *supra*. Briefly, a first hybridization array of probes  
5 can be used to scan through long stretches of DNA in a sample and control to identify base changes between the sequences by making linear arrays of sequential overlapping probes. This step allows the identification of point mutations. This is followed by a second hybridization array that allows the characterization of specific mutations by using smaller, specialized probe arrays complementary to all variants or mutations detected. Each mutation  
10 array is composed of parallel probe sets, one complementary to the wild-type gene and the other complementary to the mutant gene.

In yet another embodiment, any of a variety of sequencing reactions known in the art can be used to directly sequence the NOVX gene and detect mutations by comparing the sequence of the sample NOVX with the corresponding wild-type (control) sequence.  
15 Examples of sequencing reactions include those based on techniques developed by Maxim and Gilbert, 1977. *Proc. Natl. Acad. Sci. USA* 74: 560 or Sanger, 1977. *Proc. Natl. Acad. Sci. USA* 74: 5463. It is also contemplated that any of a variety of automated sequencing procedures can be utilized when performing the diagnostic assays (see, e.g., Naeve, *et al.*, 1995. *Biotechniques* 19: 448), including sequencing by mass spectrometry (see, e.g., PCT  
20 International Publication No. WO 94/16101; Cohen, *et al.*, 1996. *Adv. Chromatography* 36: 127-162; and Griffin, *et al.*, 1993. *Appl. Biochem. Biotechnol.* 38: 147-159).

Other methods for detecting mutations in the NOVX gene include methods in which protection from cleavage agents is used to detect mismatched bases in RNA/RNA or RNA/DNA heteroduplexes. See, e.g., Myers, *et al.*, 1985. *Science* 230: 1242. In general, the  
25 art technique of "mismatch cleavage" starts by providing heteroduplexes of formed by hybridizing (labeled) RNA or DNA containing the wild-type NOVX sequence with potentially mutant RNA or DNA obtained from a tissue sample. The double-stranded duplexes are treated with an agent that cleaves single-stranded regions of the duplex such as which will exist due to basepair mismatches between the control and sample strands. For instance,  
30 RNA/DNA duplexes can be treated with Cleavage signal-1 protein and DNA/DNA hybrids treated with S<sub>1</sub> nuclease to enzymatically digesting the mismatched regions. In other embodiments, either DNA/DNA or RNA/DNA duplexes can be treated with hydroxylamine or osmium tetroxide and with piperidine in order to digest mismatched regions. After digestion of the mismatched regions, the resulting material is then separated by size on denaturing

polyacrylamide gels to determine the site of mutation. *See, e.g., Cotton, et al., 1988. Proc. Natl. Acad. Sci. USA* 85: 4397; Saleeba, *et al., 1992. Methods Enzymol.* 217: 286-295. In an embodiment, the control DNA or RNA can be labeled for detection.

5 In still another embodiment, the mismatch cleavage reaction employs one or more proteins that recognize mismatched base pairs in double-stranded DNA (so called "DNA mismatch repair" enzymes) in defined systems for detecting and mapping point mutations in NOVX cDNAs obtained from samples of cells. For example, the mutY enzyme of *E. coli* cleaves A at G/A mismatches and the thymidine DNA glycosylase from HeLa cells cleaves T at G/T mismatches. *See, e.g., Hsu, et al., 1994. Carcinogenesis* 15: 1657-1662. According to  
10 an exemplary embodiment, a probe based on an NOVX sequence, *e.g., a wild-type NOVX sequence*, is hybridized to a cDNA or other DNA product from a test cell(s). The duplex is treated with a DNA mismatch repair enzyme, and the cleavage products, if any, can be detected from electrophoresis protocols or the like. *See, e.g., U.S. Patent No. 5,459,039.*

In other embodiments, alterations in electrophoretic mobility will be used to identify  
15 mutations in NOVX genes. For example, single strand conformation polymorphism (SSCP) may be used to detect differences in electrophoretic mobility between mutant and wild type nucleic acids. *See, e.g., Orita, et al., 1989. Proc. Natl. Acad. Sci. USA*: 86: 2766; Cotton, 1993. *Mutat. Res.* 285: 125-144; Hayashi, 1992. *Genet. Anal. Tech. Appl.* 9: 73-79. Single-stranded DNA fragments of sample and control NOVX nucleic acids will be denatured  
20 and allowed to renature. The secondary structure of single-stranded nucleic acids varies according to sequence, the resulting alteration in electrophoretic mobility enables the detection of even a single base change. The DNA fragments may be labeled or detected with labeled probes. The sensitivity of the assay may be enhanced by using RNA (rather than DNA), in which the secondary structure is more sensitive to a change in sequence. In one embodiment,  
25 the subject method utilizes heteroduplex analysis to separate double stranded heteroduplex molecules on the basis of changes in electrophoretic mobility. *See, e.g., Keen, et al., 1991. Trends Genet.* 7: 5.

In yet another embodiment, the movement of mutant or wild-type fragments in polyacrylamide gels containing a gradient of denaturant is assayed using denaturing gradient  
30 gel electrophoresis (DGGE). *See, e.g., Myers, et al., 1985. Nature* 313: 495. When DGGE is used as the method of analysis, DNA will be modified to insure that it does not completely denature, for example by adding a GC clamp of approximately 40 bp of high-melting GC-rich DNA by PCR. In a further embodiment, a temperature gradient is used in place of a

denaturing gradient to identify differences in the mobility of control and sample DNA. *See, e.g., Rosenbaum and Reissner, 1987. Biophys. Chem. 265: 12753.*

Examples of other techniques for detecting point mutations include, but are not limited to, selective oligonucleotide hybridization, selective amplification, or selective primer  
5 extension. For example, oligonucleotide primers may be prepared in which the known mutation is placed centrally and then hybridized to target DNA under conditions that permit hybridization only if a perfect match is found. *See, e.g., Saiki, et al., 1986. Nature 324: 163; Saiki, et al., 1989. Proc. Natl. Acad. Sci. USA 86: 6230.* Such allele specific oligonucleotides are hybridized to PCR amplified target DNA or a number of different mutations when the  
10 oligonucleotides are attached to the hybridizing membrane and hybridized with labeled target DNA.

Alternatively, allele specific amplification technology that depends on selective PCR amplification may be used in conjunction with the instant invention. Oligonucleotides used as primers for specific amplification may carry the mutation of interest in the center of the  
15 molecule (so that amplification depends on differential hybridization; *see, e.g., Gibbs, et al., 1989. Nucl. Acids Res. 17: 2437-2448*) or at the extreme 3'-terminus of one primer where, under appropriate conditions, mismatch can prevent, or reduce polymerase extension (*see, e.g., Prossner, 1993. Tibtech. 11: 238*). In addition it may be desirable to introduce a novel restriction site in the region of the mutation to create cleavage-based detection. *See, e.g.,*  
20 *Gasparini, et al., 1992. Mol. Cell Probes 6: 1.* It is anticipated that in certain embodiments amplification may also be performed using *Taq* ligase for amplification. *See, e.g., Barany, 1991. Proc. Natl. Acad. Sci. USA 88: 189.* In such cases, ligation will occur only if there is a perfect match at the 3'-terminus of the 5' sequence, making it possible to detect the presence of a known mutation at a specific site by looking for the presence or absence of amplification.

25 The methods described herein may be performed, for example, by utilizing pre-packaged diagnostic kits comprising at least one probe nucleic acid or antibody reagent described herein, which may be conveniently used, *e.g.,* in clinical settings to diagnose patients exhibiting symptoms or family history of a disease or illness involving an NOVX gene.

30 Furthermore, any cell type or tissue, preferably peripheral blood leukocytes, in which NOVX is expressed may be utilized in the prognostic assays described herein. However, any biological sample containing nucleated cells may be used, including, for example, buccal mucosal cells.

### Pharmacogenomics

Agents, or modulators that have a stimulatory or inhibitory effect on NOVX activity (e.g., NOVX gene expression), as identified by a screening assay described herein can be administered to individuals to treat (prophylactically or therapeutically) disorders (The disorders include metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, and hematopoietic disorders, and the various dyslipidemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers.) In conjunction with such treatment, the pharmacogenomics (i.e., the study of the relationship between an individual's genotype and that individual's response to a foreign compound or drug) of the individual may be considered. Differences in metabolism of therapeutics can lead to severe toxicity or therapeutic failure by altering the relation between dose and blood concentration of the pharmacologically active drug. Thus, the pharmacogenomics of the individual permits the selection of effective agents (e.g., drugs) for prophylactic or therapeutic treatments based on a consideration of the individual's genotype. Such pharmacogenomics can further be used to determine appropriate dosages and therapeutic regimens. Accordingly, the activity of NOVX protein, expression of NOVX nucleic acid, or mutation content of NOVX genes in an individual can be determined to thereby select appropriate agent(s) for therapeutic or prophylactic treatment of the individual.

Pharmacogenomics deals with clinically significant hereditary variations in the response to drugs due to altered drug disposition and abnormal action in affected persons. See e.g., Eichelbaum, 1996. *Clin. Exp. Pharmacol. Physiol.*, 23: 983-985; Linder, 1997. *Clin. Chem.*, 43: 254-266. In general, two types of pharmacogenetic conditions can be differentiated. Genetic conditions transmitted as a single factor altering the way drugs act on the body (altered drug action) or genetic conditions transmitted as single factors altering the way the body acts on drugs (altered drug metabolism). These pharmacogenetic conditions can occur either as rare defects or as polymorphisms. For example, glucose-6-phosphate dehydrogenase (G6PD) deficiency is a common inherited enzymopathy in which the main clinical complication is hemolysis after ingestion of oxidant drugs (anti-malarials, sulfonamides, analgesics, nitrofurans) and consumption of fava beans.

As an illustrative embodiment, the activity of drug metabolizing enzymes is a major determinant of both the intensity and duration of drug action. The discovery of genetic

polymorphisms of drug metabolizing enzymes (*e.g.*, N-acetyltransferase 2 (NAT 2) and cytochrome NEUROPEPTIDE Y/PEPTIDE YY RECEPTOR enzymes CYP2D6 and CYP2C19) has provided an explanation as to why some patients do not obtain the expected drug effects or show exaggerated drug response and serious toxicity after taking the standard and safe dose of a drug. These polymorphisms are expressed in two phenotypes in the population, the extensive metabolizer (EM) and poor metabolizer (PM). The prevalence of PM is different among different populations. For example, the gene coding for CYP2D6 is highly polymorphic and several mutations have been identified in PM, which all lead to the absence of functional CYP2D6. Poor metabolizers of CYP2D6 and CYP2C19 quite frequently experience exaggerated drug response and side effects when they receive standard doses. If a metabolite is the active therapeutic moiety, PM show no therapeutic response, as demonstrated for the analgesic effect of codeine mediated by its CYP2D6-formed metabolite morphine. At the other extreme are the so called ultra-rapid metabolizers who do not respond to standard doses. Recently, the molecular basis of ultra-rapid metabolism has been identified to be due to CYP2D6 gene amplification.

Thus, the activity of NOVX protein, expression of NOVX nucleic acid, or mutation content of NOVX genes in an individual can be determined to thereby select appropriate agent(s) for therapeutic or prophylactic treatment of the individual. In addition, pharmacogenetic studies can be used to apply genotyping of polymorphic alleles encoding drug-metabolizing enzymes to the identification of an individual's drug responsiveness phenotype. This knowledge, when applied to dosing or drug selection, can avoid adverse reactions or therapeutic failure and thus enhance therapeutic or prophylactic efficiency when treating a subject with an NOVX modulator, such as a modulator identified by one of the exemplary screening assays described herein.

### Monitoring of Effects During Clinical Trials

Monitoring the influence of agents (*e.g.*, drugs, compounds) on the expression or activity of NOVX (*e.g.*, the ability to modulate aberrant cell proliferation and/or differentiation) can be applied not only in basic drug screening, but also in clinical trials. For example, the effectiveness of an agent determined by a screening assay as described herein to increase NOVX gene expression, protein levels, or upregulate NOVX activity, can be monitored in clinical trials of subjects exhibiting decreased NOVX gene expression, protein levels, or downregulated NOVX activity. Alternatively, the effectiveness of an agent determined by a screening assay to decrease NOVX gene expression, protein levels, or

downregulate NOVX activity, can be monitored in clinical trials of subjects exhibiting increased NOVX gene expression, protein levels, or upregulated NOVX activity. In such clinical trials, the expression or activity of NOVX and, preferably, other genes that have been implicated in, for example, a cellular proliferation or immune disorder can be used as a "read out" or markers of the immune responsiveness of a particular cell.

By way of example, and not of limitation, genes, including NOVX, that are modulated in cells by treatment with an agent (*e.g.*, compound, drug or small molecule) that modulates NOVX activity (*e.g.*, identified in a screening assay as described herein) can be identified. Thus, to study the effect of agents on cellular proliferation disorders, for example, in a clinical trial, cells can be isolated and RNA prepared and analyzed for the levels of expression of NOVX and other genes implicated in the disorder. The levels of gene expression (*i.e.*, a gene expression pattern) can be quantified by Northern blot analysis or RT-PCR, as described herein, or alternatively by measuring the amount of protein produced, by one of the methods as described herein, or by measuring the levels of activity of NOVX or other genes. In this manner, the gene expression pattern can serve as a marker, indicative of the physiological response of the cells to the agent. Accordingly, this response state may be determined before, and at various points during, treatment of the individual with the agent.

In one embodiment, the invention provides a method for monitoring the effectiveness of treatment of a subject with an agent (*e.g.*, an agonist, antagonist, protein, peptide, peptidomimetic, nucleic acid, small molecule, or other drug candidate identified by the screening assays described herein) comprising the steps of (i) obtaining a pre-administration sample from a subject prior to administration of the agent; (ii) detecting the level of expression of an NOVX protein, mRNA, or genomic DNA in the preadministration sample; (iii) obtaining one or more post-administration samples from the subject; (iv) detecting the level of expression or activity of the NOVX protein, mRNA, or genomic DNA in the post-administration samples; (v) comparing the level of expression or activity of the NOVX protein, mRNA, or genomic DNA in the pre-administration sample with the NOVX protein, mRNA, or genomic DNA in the post administration sample or samples; and (vi) altering the administration of the agent to the subject accordingly. For example, increased administration of the agent may be desirable to increase the expression or activity of NOVX to higher levels than detected, *i.e.*, to increase the effectiveness of the agent. Alternatively, decreased administration of the agent may be desirable to decrease expression or activity of NOVX to lower levels than detected, *i.e.*, to decrease the effectiveness of the agent.

### Methods of Treatment

The invention provides for both prophylactic and therapeutic methods of treating a subject at risk of (or susceptible to) a disorder or having a disorder associated with aberrant NOVX expression or activity. The disorders include cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, atrial septal defect (ASD), atrioventricular (A-V) canal defect, ductus arteriosus, pulmonary stenosis, subaortic stenosis, ventricular septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, obesity, transplantation, adrenoleukodystrophy, congenital adrenal hyperplasia, prostate cancer, neoplasm; adenocarcinoma, lymphoma, uterus cancer, fertility, hemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, immunodeficiencies, graft versus host disease, AIDS, bronchial asthma, Crohn's disease; multiple sclerosis, treatment of Albright Hereditary Osteodystrophy, and other diseases, disorders and conditions of the like.

These methods of treatment will be discussed more fully, below.

### Disease and Disorders

Diseases and disorders that are characterized by increased (relative to a subject not suffering from the disease or disorder) levels or biological activity may be treated with Therapeutics that antagonize (*i.e.*, reduce or inhibit) activity. Therapeutics that antagonize activity may be administered in a therapeutic or prophylactic manner. Therapeutics that may be utilized include, but are not limited to: (i) an aforementioned peptide, or analogs, derivatives, fragments or homologs thereof; (ii) antibodies to an aforementioned peptide; (iii) nucleic acids encoding an aforementioned peptide; (iv) administration of antisense nucleic acid and nucleic acids that are "dysfunctional" (*i.e.*, due to a heterologous insertion within the coding sequences of coding sequences to an aforementioned peptide) that are utilized to "knockout" endogenous function of an aforementioned peptide by homologous recombination (*see, e.g.*, Capecchi, 1989. *Science* 244: 1288-1292); or (v) modulators (*i.e.*, inhibitors, agonists and antagonists, including additional peptide mimetic of the invention or antibodies specific to a peptide of the invention) that alter the interaction between an aforementioned peptide and its binding partner.

Diseases and disorders that are characterized by decreased (relative to a subject not suffering from the disease or disorder) levels or biological activity may be treated with Therapeutics that increase (*i.e.*, are agonists to) activity. Therapeutics that upregulate activity may be administered in a therapeutic or prophylactic manner. Therapeutics that may be

utilized include, but are not limited to, an aforementioned peptide, or analogs, derivatives, fragments or homologs thereof; or an agonist that increases bioavailability.

Increased or decreased levels can be readily detected by quantifying peptide and/or RNA, by obtaining a patient tissue sample (*e.g.*, from biopsy tissue) and assaying it *in vitro* for RNA or peptide levels, structure and/or activity of the expressed peptides (or mRNAs of an  
5 aforementioned peptide). Methods that are well-known within the art include, but are not limited to, immunoassays (*e.g.*, by Western blot analysis, immunoprecipitation followed by sodium dodecyl sulfate (SDS) polyacrylamide gel electrophoresis, immunocytochemistry, etc.) and/or hybridization assays to detect expression of mRNAs (*e.g.*, Northern assays, dot blots, *in*  
10 *situ* hybridization, and the like).

### Prophylactic Methods

In one aspect, the invention provides a method for preventing, in a subject, a disease or condition associated with an aberrant NOVX expression or activity, by administering to the  
15 subject an agent that modulates NOVX expression or at least one NOVX activity. Subjects at risk for a disease that is caused or contributed to by aberrant NOVX expression or activity can be identified by, for example, any or a combination of diagnostic or prognostic assays as described herein. Administration of a prophylactic agent can occur prior to the manifestation of symptoms characteristic of the NOVX aberrancy, such that a disease or disorder is  
20 prevented or, alternatively, delayed in its progression. Depending upon the type of NOVX aberrancy, for example, an NOVX agonist or NOVX antagonist agent can be used for treating the subject. The appropriate agent can be determined based on screening assays described herein. The prophylactic methods of the invention are further discussed in the following subsections.

25

### Therapeutic Methods

Another aspect of the invention pertains to methods of modulating NOVX expression or activity for therapeutic purposes. The modulatory method of the invention involves contacting a cell with an agent that modulates one or more of the activities of NOVX protein activity associated with the cell. An agent that modulates NOVX protein activity can be an  
30 agent as described herein, such as a nucleic acid or a protein, a naturally-occurring cognate ligand of an NOVX protein, a peptide, an NOVX peptidomimetic, or other small molecule. In one embodiment, the agent stimulates one or more NOVX protein activity. Examples of such stimulatory agents include active NOVX protein and a nucleic acid molecule encoding NOVX

that has been introduced into the cell. In another embodiment, the agent inhibits one or more NOVX protein activity. Examples of such inhibitory agents include antisense NOVX nucleic acid molecules and anti-NOVX antibodies. These modulatory methods can be performed *in vitro* (e.g., by culturing the cell with the agent) or, alternatively, *in vivo* (e.g., by administering the agent to a subject). As such, the invention provides methods of treating an individual afflicted with a disease or disorder characterized by aberrant expression or activity of an NOVX protein or nucleic acid molecule. In one embodiment, the method involves administering an agent (e.g., an agent identified by a screening assay described herein), or combination of agents that modulates (e.g., up-regulates or down-regulates) NOVX expression or activity. In another embodiment, the method involves administering an NOVX protein or nucleic acid molecule as therapy to compensate for reduced or aberrant NOVX expression or activity.

Stimulation of NOVX activity is desirable *in situations* in which NOVX is abnormally downregulated and/or in which increased NOVX activity is likely to have a beneficial effect. One example of such a situation is where a subject has a disorder characterized by aberrant cell proliferation and/or differentiation (e.g., cancer or immune associated disorders). Another example of such a situation is where the subject has a gestational disease (e.g., preeclampsia).

#### **Determination of the Biological Effect of the Therapeutic**

In various embodiments of the invention, suitable *in vitro* or *in vivo* assays are performed to determine the effect of a specific Therapeutic and whether its administration is indicated for treatment of the affected tissue.

In various specific embodiments, *in vitro* assays may be performed with representative cells of the type(s) involved in the patient's disorder, to determine if a given Therapeutic exerts the desired effect upon the cell type(s). Compounds for use in therapy may be tested in suitable animal model systems including, but not limited to rats, mice, chicken, cows, monkeys, rabbits, and the like, prior to testing in human subjects. Similarly, for *in vivo* testing, any of the animal model system known in the art may be used prior to administration to human subjects.

#### **Prophylactic and Therapeutic Uses of the Compositions of the Invention**

The NOVX nucleic acids and proteins of the invention are useful in potential prophylactic and therapeutic applications implicated in a variety of disorders including, but not limited to: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cancer, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder,

immune disorders, hematopoietic disorders, and the various dyslipidemias, metabolic disturbances associated with obesity, the metabolic syndrome X and wasting disorders associated with chronic diseases and various cancers.

As an example, a cDNA encoding the NOVX protein of the invention may be useful in gene therapy, and the protein may be useful when administered to a subject in need thereof. By way of non-limiting example, the compositions of the invention will have efficacy for treatment of patients suffering from: metabolic disorders, diabetes, obesity, infectious disease, anorexia, cancer-associated cachexia, cancer, neurodegenerative disorders, Alzheimer's Disease, Parkinson's Disorder, immune disorders, hematopoietic disorders, and the various dyslipidemias.

Both the novel nucleic acid encoding the NOVX protein, and the NOVX protein of the invention, or fragments thereof, may also be useful in diagnostic applications, wherein the presence or amount of the nucleic acid or the protein are to be assessed. A further use could be as an anti-bacterial molecule (*i.e.*, some peptides have been found to possess anti-bacterial properties). These materials are further useful in the generation of antibodies, which immunospecifically-bind to the novel substances of the invention for use in therapeutic or diagnostic methods.

The invention will be further described in the following examples, which do not limit the scope of the invention described in the claims.

## Examples

### Example 1. Identification of NOVX clones

The novel NOVX target sequences identified in the present invention were subjected to the exon linking process to confirm the sequence. PCR primers were designed by starting at the most upstream sequence available, for the forward primer, and at the most downstream sequence available for the reverse primer. Table 100A shows the sequences of the PCR primers used for obtaining different clones. In each case, the sequence was examined, walking inward from the respective termini toward the coding sequence, until a suitable sequence that is either unique or highly selective was encountered, or, in the case of the reverse primer, until the stop codon was reached. Such primers were designed based on in silico predictions for the full length cDNA, part (one or more exons) of the DNA or protein sequence of the target sequence, or by translated homology of the predicted exons to closely related human sequences from other species. These primers were then employed in PCR amplification based

on the following pool of human cDNAs: adrenal gland, bone marrow, brain - amygdala, brain - cerebellum, brain - hippocampus, brain - substantia nigra, brain - thalamus, brain - whole, fetal brain, fetal kidney, fetal liver, fetal lung, heart, kidney, lymphoma - Raji, mammary gland, pancreas, pituitary gland, placenta, prostate, salivary gland, skeletal muscle, small intestine, spinal cord, spleen, stomach, testis, thyroid, trachea, uterus. Usually the resulting amplicons were gel purified, cloned and sequenced to high redundancy. The PCR product derived from exon linking was cloned into the pCR2.1 vector from Invitrogen. The resulting bacterial clone has an insert covering the entire open reading frame cloned into the pCR2.1 vector. Table 100B shows a list of these bacterial clones. The resulting sequences from all clones were assembled with themselves, with other fragments in CuraGen Corporation's database and with public ESTs. Fragments and ESTs were included as components for an assembly when the extent of their identity with another component of the assembly was at least 95% over 50 bp. In addition, sequence traces were evaluated manually and edited for corrections if appropriate. These procedures provide the sequence reported herein.

Table 100A. PCR Primers for Exon Linking

| NOVX Clone | Primer 1 (5' - 3')            | SEQ ID NO | Primer 2 (5' - 3')             | SEQ ID NO |
|------------|-------------------------------|-----------|--------------------------------|-----------|
| NOV1d      | TGACTATGGCCTGGAGTTCCGT        | 890       | TTATTCCAGAGATCCTTGGCAGAAGC     | 891       |

Physical clone: Exons were predicted by homology and the intron/exon boundaries were determined using standard genetic rules. Exons were further selected and refined by means of similarity determination using multiple BLAST (for example, tBlastN, BlastX, and BlastN) searches, and, in some instances, GeneScan and Grail. Expressed sequences from both public and proprietary databases were also added when available to further define and complete the gene sequence. The DNA sequence was then manually corrected for apparent inconsistencies thereby obtaining the sequences encoding the full-length protein.

Table 100B. Physical Clones for PCR products

| NOVX Clone | Bacterial Clone                                                       |

**Example 2. Quantitative expression analysis of clones in various cells and tissues**

The quantitative expression of various clones was assessed using microtiter plates containing RNA samples from a variety of normal and pathology-derived cells, cell lines and tissues using real time quantitative PCR (RTQ PCR). RTQ PCR was performed on an Applied Biosystems ABI PRISM® 7700 or an ABI PRISM® 7900 HT Sequence Detection System.

5 Various collections of samples are assembled on the plates, and referred to as Panel 1 (containing normal tissues and cancer cell lines), Panel 2 (containing samples derived from tissues from normal and cancer sources), Panel 3 (containing cancer cell lines), Panel 4 (containing cells and cell lines from normal tissues and cells related to inflammatory conditions), Panel 5D/5I (containing human tissues and cell lines with an emphasis on  
10 metabolic diseases), AI\_comprehensive\_panel (containing normal tissue and samples from autoimmune diseases), Panel CNSD.01 (containing central nervous system samples from normal and diseased brains) and CNS\_neurodegeneration\_panel (containing samples from normal and Alzheimer's diseased brains).

RNA integrity from all samples is controlled for quality by visual assessment of  
15 agarose gel electropherograms using 28S and 18S ribosomal RNA staining intensity ratio as a guide (2:1 to 2.5:1 28s:18s) and the absence of low molecular weight RNAs that would be indicative of degradation products. Samples are controlled against genomic DNA contamination by RTQ PCR reactions run in the absence of reverse transcriptase using probe and primer sets designed to amplify across the span of a single exon.

20 First, the RNA samples were normalized to reference nucleic acids such as constitutively expressed genes (for example,  $\beta$ -actin and GAPDH). Normalized RNA (5  $\mu$ l) was converted to cDNA and analyzed by RTQ-PCR using One Step RT-PCR Master Mix Reagents (Applied Biosystems; Catalog No. 4309169) and gene-specific primers according to the manufacturer's instructions.

25 In other cases, non-normalized RNA samples were converted to single strand cDNA (sscDNA) using Superscript II (Invitrogen Corporation; Catalog No. 18064-147) and random hexamers according to the manufacturer's instructions. Reactions containing up to 10  $\mu$ g of total RNA were performed in a volume of 20  $\mu$ l and incubated for 60 minutes at 42°C. This reaction can be scaled up to 50  $\mu$ g of total RNA in a final volume of 100  $\mu$ l. sscDNA samples  
30 are then normalized to reference nucleic acids as described previously, using 1X TaqMan® Universal Master mix (Applied Biosystems; catalog No. 4324020), following the manufacturer's instructions.

Probes and primers were designed for each assay according to Applied Biosystems Primer Express Software package (version I for Apple Computer's Macintosh Power PC) or a

similar algorithm using the target sequence as input. Default settings were used for reaction conditions and the following parameters were set before selecting primers: primer concentration = 250 nM, primer melting temperature ( $T_m$ ) range = 58°-60°C, primer optimal  $T_m$  = 59°C, maximum primer difference = 2°C, probe does not have 5'G, probe  $T_m$  must be 10°C greater than primer  $T_m$ , amplicon size 75bp to 100bp. The probes and primers selected (see below) were synthesized by Synthegen (Houston, TX, USA). Probes were double purified by HPLC to remove uncoupled dye and evaluated by mass spectroscopy to verify coupling of reporter and quencher dyes to the 5' and 3' ends of the probe, respectively. Their final concentrations were: forward and reverse primers, 900nM each, and probe, 200nM.

10        PCR conditions: When working with RNA samples, normalized RNA from each tissue and each cell line was spotted in each well of either a 96 well or a 384-well PCR plate (Applied Biosystems). PCR cocktails included either a single gene specific probe and primers set, or two multiplexed probe and primers sets (a set specific for the target clone and another gene-specific set multiplexed with the target probe). PCR reactions were set up using 15        TaqMan® One-Step RT-PCR Master Mix (Applied Biosystems, Catalog No. 4313803) following manufacturer's instructions. Reverse transcription was performed at 48°C for 30 minutes followed by amplification/PCR cycles as follows: 95°C 10 min, then 40 cycles of 95°C for 15 seconds, 60°C for 1 minute. Results were recorded as CT values (cycle at which a given sample crosses a threshold level of fluorescence) using a log scale, with the difference in 20        RNA concentration between a given sample and the sample with the lowest CT value being represented as 2 to the power of delta CT. The percent relative expression is then obtained by taking the reciprocal of this RNA difference and multiplying by 100.

      When working with sscDNA samples, normalized sscDNA was used as described previously for RNA samples. PCR reactions containing one or two sets of probe and primers 25        were set up as described previously, using 1X TaqMan® Universal Master mix (Applied Biosystems; catalog No. 4324020), following the manufacturer's instructions. PCR amplification was performed as follows: 95°C 10 min, then 40 cycles of 95°C for 15 seconds, 60°C for 1 minute. Results were analyzed and processed as described previously.

#### **Panels 1, 1.1, 1.2, and 1.3D**

30        The plates for Panels 1, 1.1, 1.2 and 1.3D include 2 control wells (genomic DNA control and chemistry control) and 94 wells containing cDNA from various samples. The samples in these panels are broken into 2 classes: samples derived from cultured cell lines and samples derived from primary normal tissues. The cell lines are derived from cancers of the following types: lung cancer, breast cancer, melanoma, colon cancer, prostate cancer, CNS

cancer, squamous cell carcinoma, ovarian cancer, liver cancer, renal cancer, gastric cancer and pancreatic cancer. Cell lines used in these panels are widely available through the American Type Culture Collection (ATCC), a repository for cultured cell lines, and were cultured using the conditions recommended by the ATCC. The normal tissues found on these panels are  
5 comprised of samples derived from all major organ systems from single adult individuals or fetuses. These samples are derived from the following organs: adult skeletal muscle, fetal skeletal muscle, adult heart, fetal heart, adult kidney, fetal kidney, adult liver, fetal liver, adult lung, fetal lung, various regions of the brain, the spleen, bone marrow, lymph node, pancreas, salivary gland, pituitary gland, adrenal gland, spinal cord, thymus, stomach, small intestine,  
10 colon, bladder, trachea, breast, ovary, uterus, placenta, prostate, testis and adipose.

In the results for Panels 1, 1.1, 1.2 and 1.3D, the following abbreviations are used:

ca. = carcinoma,  
\* = established from metastasis,  
met = metastasis,  
15 s cell var = small cell variant,  
non-s = non-sm = non-small,  
squam = squamous,  
pl. eff = pl effusion = pleural effusion,  
glio = glioma,  
20 astro = astrocytoma, and  
neuro = neuroblastoma.

#### **General\_screening\_panel\_v1.4**

The plates for Panel 1.4 include 2 control wells (genomic DNA control and chemistry control) and 94 wells containing cDNA from various samples. The samples in Panel 1.4 are  
25 broken into 2 classes: samples derived from cultured cell lines and samples derived from primary normal tissues. The cell lines are derived from cancers of the following types: lung cancer, breast cancer, melanoma, colon cancer, prostate cancer, CNS cancer, squamous cell carcinoma, ovarian cancer, liver cancer, renal cancer, gastric cancer and pancreatic cancer. Cell lines used in Panel 1.4 are widely available through the American Type Culture  
30 Collection (ATCC), a repository for cultured cell lines, and were cultured using the conditions recommended by the ATCC. The normal tissues found on Panel 1.4 are comprised of pools of samples derived from all major organ systems from 2 to 5 different adult individuals or fetuses. These samples are derived from the following organs: adult skeletal muscle, fetal skeletal muscle, adult heart, fetal heart, adult kidney, fetal kidney, adult liver, fetal liver, adult

lung, fetal lung, various regions of the brain, the spleen, bone marrow, lymph node, pancreas, salivary gland, pituitary gland, adrenal gland, spinal cord, thymus, stomach, small intestine, colon, bladder, trachea, breast, ovary, uterus, placenta, prostate, testis and adipose.

Abbreviations are as described for Panels 1, 1.1, 1.2, and 1.3D.

5           **Panels 2D and 2.2**

The plates for Panels 2D and 2.2 generally include 2 control wells and 94 test samples composed of RNA or cDNA isolated from human tissue procured by surgeons working in close cooperation with the National Cancer Institute's Cooperative Human Tissue Network (CHTN) or the National Disease Research Initiative (NDRI). The tissues are derived from  
10 human malignancies and in cases where indicated many malignant tissues have "matched margins" obtained from noncancerous tissue just adjacent to the tumor. These are termed normal adjacent tissues and are denoted "NAT" in the results below. The tumor tissue and the "matched margins" are evaluated by two independent pathologists (the surgical pathologists and again by a pathologist at NDRI or CHTN). This analysis provides a gross  
15 histopathological assessment of tumor differentiation grade. Moreover, most samples include the original surgical pathology report that provides information regarding the clinical stage of the patient. These matched margins are taken from the tissue surrounding (i.e. immediately proximal) to the zone of surgery (designated "NAT", for normal adjacent tissue, in Table RR). In addition, RNA and cDNA samples were obtained from various human tissues derived from  
20 autopsies performed on elderly people or sudden death victims (accidents, etc.). These tissues were ascertained to be free of disease and were purchased from various commercial sources such as Clontech (Palo Alto, CA), Research Genetics, and Invitrogen.

**Panel 3D**

The plates of Panel 3D are comprised of 94 cDNA samples and two control samples.  
25 Specifically, 92 of these samples are derived from cultured human cancer cell lines, 2 samples of human primary cerebellar tissue and 2 controls. The human cell lines are generally obtained from ATCC (American Type Culture Collection), NCI or the German tumor cell bank and fall into the following tissue groups: Squamous cell carcinoma of the tongue, breast cancer, prostate cancer, melanoma, epidermoid carcinoma, sarcomas, bladder carcinomas, pancreatic  
30 cancers, kidney cancers, leukemias/lymphomas, ovarian/uterine/cervical, gastric, colon, lung and CNS cancer cell lines. In addition, there are two independent samples of cerebellum. These cells are all cultured under standard recommended conditions and RNA extracted using the standard procedures. The cell lines in panel 3D and 1.3D are of the most common cell lines used in the scientific literature.

**Panels 4D, 4R, and 4.1D**

Panel 4 includes samples on a 96 well plate (2 control wells, 94 test samples) composed of RNA (Panel 4R) or cDNA (Panels 4D/4.1D) isolated from various human cell lines or tissues related to inflammatory conditions. Total RNA from control normal tissues  
5 such as colon and lung (Stratagene, La Jolla, CA) and thymus and kidney (Clontech) was employed. Total RNA from liver tissue from cirrhosis patients and kidney from lupus patients was obtained from BioChain (Biochain Institute, Inc., Hayward, CA). Intestinal tissue for RNA preparation from patients diagnosed as having Crohn's disease and ulcerative colitis was obtained from the National Disease Research Interchange (NDRI) (Philadelphia, PA).

10 Astrocytes, lung fibroblasts, dermal fibroblasts, coronary artery smooth muscle cells, small airway epithelium, bronchial epithelium, microvascular dermal endothelial cells, microvascular lung endothelial cells, human pulmonary aortic endothelial cells, human umbilical vein endothelial cells were all purchased from Clonetics (Walkersville, MD) and grown in the media supplied for these cell types by Clonetics. These primary cell types were  
15 activated with various cytokines or combinations of cytokines for 6 and/or 12-14 hours, as indicated. The following cytokines were used; IL-1 beta at approximately 1-5ng/ml, TNF alpha at approximately 5-10ng/ml, IFN gamma at approximately 20-50ng/ml, IL-4 at approximately 5-10ng/ml, IL-9 at approximately 5-10ng/ml, IL-13 at approximately 5-10ng/ml. Endothelial cells were sometimes starved for various times by culture in the basal  
20 media from Clonetics with 0.1% serum.

Mononuclear cells were prepared from blood of employees at CuraGen Corporation, using Ficoll. LAK cells were prepared from these cells by culture in DMEM 5% FCS (Hyclone), 100µM non essential amino acids (Gibco/Life Technologies, Rockville, MD), 1mM sodium pyruvate (Gibco), mercaptoethanol  $5.5 \times 10^{-5}$ M (Gibco), and 10mM Hepes  
25 (Gibco) and Interleukin 2 for 4-6 days. Cells were then either activated with 10-20ng/ml PMA and 1-2µg/ml ionomycin, IL-12 at 5-10ng/ml, IFN gamma at 20-50ng/ml and IL-18 at 5-10ng/ml for 6 hours. In some cases, mononuclear cells were cultured for 4-5 days in DMEM 5% FCS (Hyclone), 100µM non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol  $5.5 \times 10^{-5}$ M (Gibco), and 10mM Hepes (Gibco) with PHA  
30 (phytohemagglutinin) or PWM (pokeweed mitogen) at approximately 5µg/ml. Samples were taken at 24, 48 and 72 hours for RNA preparation. MLR (mixed lymphocyte reaction) samples were obtained by taking blood from two donors, isolating the mononuclear cells using Ficoll and mixing the isolated mononuclear cells 1:1 at a final concentration of approximately  $2 \times 10^6$  cells/ml in DMEM 5% FCS (Hyclone), 100µM non essential amino acids (Gibco), 1mM

sodium pyruvate (Gibco), mercaptoethanol ( $5.5 \times 10^{-5} \text{M}$ ) (Gibco), and 10mM Hepes (Gibco). The MLR was cultured and samples taken at various time points ranging from 1- 7 days for RNA preparation.

Monocytes were isolated from mononuclear cells using CD14 Miltenyi Beads, +ve VS  
5 selection columns and a Vario Magnet according to the manufacturer's instructions. Monocytes were differentiated into dendritic cells by culture in DMEM 5% fetal calf serum (FCS) (Hyclone, Logan, UT), 100 $\mu\text{M}$  non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol  $5.5 \times 10^{-5} \text{M}$  (Gibco), and 10mM Hepes (Gibco), 50ng/ml GMCSF and 5ng/ml IL-4 for 5-7 days. Macrophages were prepared by culture of monocytes  
10 for 5-7 days in DMEM 5% FCS (Hyclone), 100 $\mu\text{M}$  non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol  $5.5 \times 10^{-5} \text{M}$  (Gibco), 10mM Hepes (Gibco) and 10% AB Human Serum or MCSF at approximately 50ng/ml. Monocytes, macrophages and dendritic cells were stimulated for 6 and 12-14 hours with lipopolysaccharide (LPS) at 100ng/ml. Dendritic cells were also stimulated with anti-CD40 monoclonal antibody  
15 (Pharmingen) at 10 $\mu\text{g/ml}$  for 6 and 12-14 hours.

CD4 lymphocytes, CD8 lymphocytes and NK cells were also isolated from mononuclear cells using CD4, CD8 and CD56 Miltenyi beads, positive VS selection columns and a Vario Magnet according to the manufacturer's instructions. CD45RA and CD45RO CD4 lymphocytes were isolated by depleting mononuclear cells of CD8, CD56, CD14 and CD19  
20 cells using CD8, CD56, CD14 and CD19 Miltenyi beads and positive selection. CD45RO beads were then used to isolate the CD45RO CD4 lymphocytes with the remaining cells being CD45RA CD4 lymphocytes. CD45RA CD4, CD45RO CD4 and CD8 lymphocytes were placed in DMEM 5% FCS (Hyclone), 100 $\mu\text{M}$  non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol  $5.5 \times 10^{-5} \text{M}$  (Gibco), and 10mM Hepes (Gibco) and  
25 plated at  $10^6$  cells/ml onto Falcon 6 well tissue culture plates that had been coated overnight with 0.5 $\mu\text{g/ml}$  anti-CD28 (Pharmingen) and 3 $\mu\text{g/ml}$  anti-CD3 (OKT3, ATCC) in PBS. After 6 and 24 hours, the cells were harvested for RNA preparation. To prepare chronically activated CD8 lymphocytes, we activated the isolated CD8 lymphocytes for 4 days on anti-CD28 and anti-CD3 coated plates and then harvested the cells and expanded them in DMEM 5% FCS  
30 (Hyclone), 100 $\mu\text{M}$  non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol  $5.5 \times 10^{-5} \text{M}$  (Gibco), and 10mM Hepes (Gibco) and IL-2. The expanded CD8 cells were then activated again with plate bound anti-CD3 and anti-CD28 for 4 days and expanded as before. RNA was isolated 6 and 24 hours after the second activation and after 4 days of the second expansion culture. The isolated NK cells were cultured in DMEM 5% FCS

(Hyclone), 100 $\mu$ M non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5x10<sup>-5</sup>M (Gibco), and 10mM Hepes (Gibco) and IL-2 for 4-6 days before RNA was prepared.

To obtain B cells, tonsils were procured from NDRI. The tonsil was cut up with sterile  
5 dissecting scissors and then passed through a sieve. Tonsil cells were then spun down and resuspended at 10<sup>6</sup>cells/ml in DMEM 5% FCS (Hyclone), 100 $\mu$ M non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5x10<sup>-5</sup>M (Gibco), and 10mM Hepes (Gibco). To activate the cells, we used PWM at 5 $\mu$ g/ml or anti-CD40 (Pharmingen) at approximately 10 $\mu$ g/ml and IL-4 at 5-10ng/ml. Cells were harvested for RNA preparation at  
10 24, 48 and 72 hours.

To prepare the primary and secondary Th1/Th2 and Tr1 cells, six-well Falcon plates were coated overnight with 10 $\mu$ g/ml anti-CD28 (Pharmingen) and 2 $\mu$ g/ml OKT3 (ATCC), and then washed twice with PBS. Umbilical cord blood CD4 lymphocytes (Poietic Systems, German Town, MD) were cultured at 10<sup>5</sup>-10<sup>6</sup>cells/ml in DMEM 5% FCS (Hyclone), 100 $\mu$ M  
15 non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5x10<sup>-5</sup>M (Gibco), 10mM Hepes (Gibco) and IL-2 (4ng/ml). IL-12 (5ng/ml) and anti-IL4 (1 $\mu$ g/ml) were used to direct to Th1, while IL-4 (5ng/ml) and anti-IFN gamma (1 $\mu$ g/ml) were used to direct to Th2 and IL-10 at 5ng/ml was used to direct to Tr1. After 4-5 days, the activated Th1, Th2 and Tr1 lymphocytes were washed once in DMEM and expanded for 4-7 days in DMEM  
20 5% FCS (Hyclone), 100 $\mu$ M non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol 5.5x10<sup>-5</sup>M (Gibco), 10mM Hepes (Gibco) and IL-2 (1ng/ml). Following this, the activated Th1, Th2 and Tr1 lymphocytes were re-stimulated for 5 days with anti-CD28/OKT3 and cytokines as described above, but with the addition of anti-CD95L (1 $\mu$ g/ml) to prevent apoptosis. After 4-5 days, the Th1, Th2 and Tr1 lymphocytes were  
25 washed and then expanded again with IL-2 for 4-7 days. Activated Th1 and Th2 lymphocytes were maintained in this way for a maximum of three cycles. RNA was prepared from primary and secondary Th1, Th2 and Tr1 after 6 and 24 hours following the second and third activations with plate bound anti-CD3 and anti-CD28 mAbs and 4 days into the second and third expansion cultures in Interleukin 2.

30 The following leukocyte cells lines were obtained from the ATCC: Ramos, EOL-1, KU-812. EOL cells were further differentiated by culture in 0.1mM dbcAMP at 5x10<sup>5</sup>cells/ml for 8 days, changing the media every 3 days and adjusting the cell concentration to 5x10<sup>5</sup>cells/ml. For the culture of these cells, we used DMEM or RPMI (as recommended by the ATCC), with the addition of 5% FCS (Hyclone), 100 $\mu$ M non essential amino acids

(Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol  $5.5 \times 10^{-5}$ M (Gibco), 10mM Hepes (Gibco). RNA was either prepared from resting cells or cells activated with PMA at 10ng/ml and ionomycin at 1 $\mu$ g/ml for 6 and 14 hours. Keratinocyte line CCD106 and an airway epithelial tumor line NCI-H292 were also obtained from the ATCC. Both were cultured in  
5 DMEM 5% FCS (Hyclone), 100 $\mu$ M non essential amino acids (Gibco), 1mM sodium pyruvate (Gibco), mercaptoethanol  $5.5 \times 10^{-5}$ M (Gibco), and 10mM Hepes (Gibco). CCD1106 cells were activated for 6 and 14 hours with approximately 5 ng/ml TNF alpha and 1ng/ml IL-1 beta, while NCI-H292 cells were activated for 6 and 14 hours with the following cytokines: 5ng/ml IL-4, 5ng/ml IL-9, 5ng/ml IL-13 and 25ng/ml IFN gamma.

10 For these cell lines and blood cells, RNA was prepared by lysing approximately  $10^7$  cells/ml using Trizol (Gibco BRL). Briefly, 1/10 volume of bromochloropropane (Molecular Research Corporation) was added to the RNA sample, vortexed and after 10 minutes at room temperature, the tubes were spun at 14,000 rpm in a Sorvall SS34 rotor. The aqueous phase was removed and placed in a 15ml Falcon Tube. An equal volume of  
15 isopropanol was added and left at -20°C overnight. The precipitated RNA was spun down at 9,000 rpm for 15 min in a Sorvall SS34 rotor and washed in 70% ethanol. The pellet was redissolved in 300 $\mu$ l of RNase-free water and 35 $\mu$ l buffer (Promega) 5 $\mu$ l DTT, 7 $\mu$ l RNAsin and 8 $\mu$ l DNase were added. The tube was incubated at 37°C for 30 minutes to remove contaminating genomic DNA, extracted once with phenol:chloroform and re-precipitated with  
20 1/10 volume of 3M sodium acetate and 2 volumes of 100% ethanol. The RNA was spun down and placed in RNase free water. RNA was stored at -80°C.

#### AI\_comprehensive panel\_v1.0

The plates for AI\_comprehensive panel\_v1.0 include two control wells and 89 test samples comprised of cDNA isolated from surgical and postmortem human tissues obtained  
25 from the Backus Hospital and Clinomics (Frederick, MD). Total RNA was extracted from tissue samples from the Backus Hospital in the Facility at CuraGen. Total RNA from other tissues was obtained from Clinomics.

Joint tissues including synovial fluid, synovium, bone and cartilage were obtained from patients undergoing total knee or hip replacement surgery at the Backus Hospital. Tissue  
30 samples were immediately snap frozen in liquid nitrogen to ensure that isolated RNA was of optimal quality and not degraded. Additional samples of osteoarthritis and rheumatoid arthritis joint tissues were obtained from Clinomics. Normal control tissues were supplied by Clinomics and were obtained during autopsy of trauma victims.

Surgical specimens of psoriatic tissues and adjacent matched tissues were provided as total RNA by Clinomics. Two male and two female patients were selected between the ages of 25 and 47. None of the patients were taking prescription drugs at the time samples were isolated.

5           Surgical specimens of diseased colon from patients with ulcerative colitis and Crohns disease and adjacent matched tissues were obtained from Clinomics. Bowel tissue from three female and three male Crohn's patients between the ages of 41-69 were used. Two patients were not on prescription medication while the others were taking dexamethasone, phenobarbital, or tylenol. Ulcerative colitis tissue was from three male and four female  
10 patients. Four of the patients were taking lebid and two were on phenobarbital.

Total RNA from post mortem lung tissue from trauma victims with no disease or with emphysema, asthma or COPD was purchased from Clinomics. Emphysema patients ranged in age from 40-70 and all were smokers, this age range was chosen to focus on patients with cigarette-linked emphysema and to avoid those patients with alpha-1-antitrypsin deficiencies.  
15 Asthma patients ranged in age from 36-75, and excluded smokers to prevent those patients that could also have COPD. COPD patients ranged in age from 35-80 and included both smokers and non-smokers. Most patients were taking corticosteroids, and bronchodilators.

In the labels employed to identify tissues in the AI\_comprehensive panel\_v1.0 panel, the following abbreviations are used:

20           AI = Autoimmunity  
            Syn = Synovial  
            Normal = No apparent disease  
            Rep22 /Rep20 = individual patients  
            RA = Rheumatoid arthritis  
25           Backus = From Backus Hospital  
            OA = Osteoarthritis  
            (SS) (BA) (MF) = Individual patients  
            Adj = Adjacent tissue  
            Match control = adjacent tissues  
30           -M = Male  
            -F = Female  
            COPD = Chronic obstructive pulmonary disease  
            Panels 5D and 5I

The plates for Panel 5D and 5I include two control wells and a variety of cDNAs isolated from human tissues and cell lines with an emphasis on metabolic diseases. Metabolic tissues were obtained from patients enrolled in the Gestational Diabetes study. Cells were obtained during different stages in the differentiation of adipocytes from human mesenchymal stem cells. Human pancreatic islets were also obtained.

In the Gestational Diabetes study subjects are young (18 - 40 years), otherwise healthy women with and without gestational diabetes undergoing routine (elective) Caesarean section. After delivery of the infant, when the surgical incisions were being repaired/closed, the obstetrician removed a small sample (<1 cc) of the exposed metabolic tissues during the closure of each surgical level. The biopsy material was rinsed in sterile saline, blotted and fast frozen within 5 minutes from the time of removal. The tissue was then flash frozen in liquid nitrogen and stored, individually, in sterile screw-top tubes and kept on dry ice for shipment to or to be picked up by CuraGen. The metabolic tissues of interest include uterine wall (smooth muscle), visceral adipose, skeletal muscle (rectus) and subcutaneous adipose. Patient descriptions are as follows:

|             |                                               |
|-------------|-----------------------------------------------|
| Patient 2   | Diabetic Hispanic, overweight, not on insulin |
| Patient 7-9 | Nondiabetic Caucasian and obese (BMI>30)      |
| Patient 10  | Diabetic Hispanic, overweight, on insulin     |
| Patient 11  | Nondiabetic African American and overweight   |
| Patient 12  | Diabetic Hispanic on insulin                  |

Adipocyte differentiation was induced in donor progenitor cells obtained from Osirus (a division of Clonetics/BioWhittaker) in triplicate, except for Donor 3U which had only two replicates. Scientists at Clonetics isolated, grew and differentiated human mesenchymal stem cells (HuMSCs) for CuraGen based on the published protocol found in Mark F. Pittenger, et al., Multilineage Potential of Adult Human Mesenchymal Stem Cells Science Apr 2 1999: 143-147. Clonetics provided Trizol lysates or frozen pellets suitable for mRNA isolation and ds cDNA production. A general description of each donor is as follows:

Donor 2 and 3 U: Mesenchymal Stem cells, Undifferentiated Adipose  
 Donor 2 and 3 AM: Adipose, AdiposeMidway Differentiated  
 Donor 2 and 3 AD: Adipose, Adipose Differentiated

Human cell lines were generally obtained from ATCC (American Type Culture Collection), NCI or the German tumor cell bank and fall into the following tissue groups:

kidney proximal convoluted tubule, uterine smooth muscle cells, small intestine, liver HepG2 cancer cells, heart primary stromal cells, and adrenal cortical adenoma cells. These cells are all cultured under standard recommended conditions and RNA extracted using the standard procedures. All samples were processed at CuraGen to produce single stranded cDNA.

5 Panel 5I contains all samples previously described with the addition of pancreatic islets from a 58 year old female patient obtained from the Diabetes Research Institute at the University of Miami School of Medicine. Islet tissue was processed to total RNA at an outside source and delivered to CuraGen for addition to panel 5I.

In the labels employed to identify tissues in the 5D and 5I panels, the following  
10 abbreviations are used:

GO Adipose = Greater Omentum Adipose

SK = Skeletal Muscle

UT = Uterus

PL = Placenta

15 AD = Adipose Differentiated

AM = Adipose Midway Differentiated

U = Undifferentiated Stem Cells

**Panel CNSD.01**

The plates for Panel CNSD.01 include two control wells and 94 test samples  
20 comprised of cDNA isolated from postmortem human brain tissue obtained from the Harvard Brain Tissue Resource Center. Brains are removed from calvaria of donors between 4 and 24 hours after death, sectioned by neuroanatomists, and frozen at -80°C in liquid nitrogen vapor. All brains are sectioned and examined by neuropathologists to confirm diagnoses with clear associated neuropathology.

25 Disease diagnoses are taken from patient records. The panel contains two brains from each of the following diagnoses: Alzheimer's disease, Parkinson's disease, Huntington's disease, Progressive Supranuclear Palsy, Depression, and "Normal controls". Within each of these brains, the following regions are represented: cingulate gyrus, temporal pole, globus pallidus, substantia nigra, Brodman Area 4 (primary motor strip), Brodman Area 7 (parietal  
30 cortex), Brodman Area 9 (prefrontal cortex), and Brodman area 17 (occipital cortex). Not all brain regions are represented in all cases; e.g., Huntington's disease is characterized in part by neurodegeneration in the globus pallidus, thus this region is impossible to obtain from confirmed Huntington's cases. Likewise Parkinson's disease is characterized by degeneration of the substantia nigra making this region more difficult to obtain. Normal control brains were

examined for neuropathology and found to be free of any pathology consistent with neurodegeneration.

In the labels employed to identify tissues in the CNS panel, the following abbreviations are used:

5 PSP = Progressive supranuclear palsy

Sub Nigra = Substantia nigra

Glob Palladus= Globus palladus

Temp Pole = Temporal pole

Cing Gyr = Cingulate gyrus

10 BA 4 = Brodman Area 4

**Panel CNS\_Neurodegeneration\_V1.0**

The plates for Panel CNS\_Neurodegeneration\_V1.0 include two control wells and 47 test samples comprised of cDNA isolated from postmortem human brain tissue obtained from the Harvard Brain Tissue Resource Center (McLean Hospital) and the Human Brain and Spinal Fluid Resource Center (VA Greater Los Angeles Healthcare System). Brains are removed from calvaria of donors between 4 and 24 hours after death, sectioned by neuroanatomists, and frozen at -80°C in liquid nitrogen vapor. All brains are sectioned and examined by neuropathologists to confirm diagnoses with clear associated neuropathology.

Disease diagnoses are taken from patient records. The panel contains six brains from Alzheimer's disease (AD) patients, and eight brains from "Normal controls" who showed no evidence of dementia prior to death. The eight normal control brains are divided into two categories: Controls with no dementia and no Alzheimer's like pathology (Controls) and controls with no dementia but evidence of severe Alzheimer's like pathology, (specifically senile plaque load rated as level 3 on a scale of 0-3; 0 = no evidence of plaques, 3 = severe AD senile plaque load). Within each of these brains, the following regions are represented: hippocampus, temporal cortex (Brodman Area 21), parietal cortex (Brodman area 7), and occipital cortex (Brodman area 17). These regions were chosen to encompass all levels of neurodegeneration in AD. The hippocampus is a region of early and severe neuronal loss in AD; the temporal cortex is known to show neurodegeneration in AD after the hippocampus; the parietal cortex shows moderate neuronal death in the late stages of the disease; the occipital cortex is spared in AD and therefore acts as a "control" region within AD patients. Not all brain regions are represented in all cases.

In the labels employed to identify tissues in the CNS\_Neurodegeneration\_V1.0 panel, the following abbreviations are used:

AD = Alzheimer's disease brain; patient was demented and showed AD-like pathology upon autopsy

Control = Control brains; patient not demented, showing no neuropathology

Control (Path) = Control brains; patient not demented but showing severe AD-like pathology

SupTemporal Ctx = Superior Temporal Cortex

Inf Temporal Ctx = Inferior Temporal Cortex

### NOV9a and NOV9b

Expression of gene NOV9a and variant NOV9b was assessed using the primer-probe sets Ag2930, Ag4297 and Ag573, described in Tables AA, AB and AC. Results of the RTQ-PCR runs are shown in Tables AD, AE, AF, AG, and AH. Please note that the probe and primer set Ag4297 do not match the NOV9b variant.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2930 Expression of the NOV9A gene is low/undetectable in all samples on this panel. (CTs>35). (Data not shown.)

**General\_screening\_panel\_v1.5 Summary:** Ag4297 Expression of the NOV9A gene is low/undetectable in all samples on this panel. (CTs>35). (Data not shown.)

- 5 **Panel 1.1 Summary:** Ag573 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the NOV9A gene, a putative neuropeptide Y receptor, in lung cancer and renal cancer cell lines (CTs=23-26). Significant expression is also seen in a cluster of breast cancer cell lines. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel
- 10 and as a marker to detect the presence of these cancers. Neuropeptide Y, which controls vasoconstriction and feeding behavior, is expressed in breast cancer (see ref. below). Furthermore, peptide receptors in human tumors represent clinically relevant targets for both

cancer diagnosis and treatment. Therefore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of breast, lung and renal cancers.

This molecule, which encodes a neuropeptide Y receptor homolog, is also expressed in the brain. Neuropeptide Y and its receptors have been implicated in feeding behavior, learning and memory, and seizure. This gene would therefore be an excellent small molecule target for the treatment of epilepsy or any seizure disorder.

Among tissues with metabolic function, this gene has low-to-moderate levels of expression in adrenal, heart, fetal skeletal muscle and pancreas. This gene product is highly expressed in fetal and adult heart. Since neuropeptide Y and its receptor are associated with appetite regulation, this gene product may be a small molecule target for the treatment of metabolic and endocrine disease, including obesity and Types 1 and 2 diabetes. In addition, the expression in heart and the suggested role of neuropeptide Y in vasoconstriction, cardiovascular signaling, and development of the heart suggest that this gene product may be useful in treating disorders that affect the heart.

Reubi JC, Gugger M, Waser B, Schaer JC. Y(1)-mediated effect of neuropeptide Y in cancer: breast carcinomas as targets. *Cancer Res* 2001 Jun 1;61(11):4636-41

Overexpression of selected peptide receptors in human tumors has been shown to represent clinically relevant targets for cancer diagnosis and therapy. Neuropeptide Y (NPY) is a peptide neurotransmitter mediating feeding behavior and vasoconstriction. It has never been shown to be involved in human cancer. We show here, using in vitro receptor autoradiography, a NPY receptor incidence of 85% in primary human breast carcinomas (n = 95) and of 100% in lymph node metastases of receptor-positive primaries (n = 27), predominantly as Y(1) subtype, whereas non-neoplastic human breast expressed Y(2) preferentially. Y(1) mRNA was detected in Y(1)-expressing tumors by in situ hybridization, whereas Y(2) mRNA was found in normal breast tissue. The strong predominance of Y(1) in breast carcinomas compared with Y(2) in normal breast suggests that neoplastic transformation can switch the NPY receptor expression from Y(2) to Y(1) subtype. Moreover, in Y(1)-expressing human SK-N-MC tumor cells, an NPY-induced, dose-dependent inhibition of tumor cell growth of >40% was observed, suggesting a functional role of NPY in cancer, mediated by Y(1). NPY should therefore be added to the list of small regulatory peptides related to cancer. The high incidence of Y(1) in in situ, invasive, and metastatic breast cancers allows for the possibility to target them for diagnosis and therapy with NPY analogues.

Furtinger S, Pirker S, Czech T, Baumgartner C, Ransmayr G, Sperk G. Plasticity of Y1 and Y2 receptors and neuropeptide Y fibers in patients with temporal lobe epilepsy. *J Neurosci* 2001 Aug 1;21(15):5804-12

5 Marked expression of neuropeptide Y (NPY) and its Y2 receptors in hippocampal mossy fibers has been reported in animal models of epilepsy. Because NPY can suppress glutamate release by activating presynaptic Y2 receptors, these changes have been proposed as an endogenous protective mechanism. Therefore, we investigated whether similar changes in the NPY system may also take place in human epilepsy. We investigated Y1 and Y2 receptor binding and NPY immunoreactivity in hippocampal specimens that were obtained at surgery  
10 from patients with temporal lobe epilepsy and in autopsy controls. Significant increases in Y2 receptor binding (by 43-48%) were observed in the dentate hilus, sectors CA1 to CA3, and subiculum of specimens with, but not in those without, hippocampal sclerosis. On the other hand, Y1 receptor binding was significantly reduced (by 62%) in the dentate molecular layer of sclerotic specimens. In the same patients, the total lengths of NPY immunoreactive (NPY-  
15 IR) fibers was markedly increased (by 115-958%) in the dentate molecular layer and hilus, in the stratum lucidum of CA3, and throughout sectors CA1 to CA3 and the subiculum, as compared with autopsies. In nonsclerotic specimens, increases in lengths of NPY-IR fibers were more moderate and statistically not significant. NPY mRNA was increased threefold in hilar interneurons of sclerotic and nonsclerotic specimens. It is suggested that abundant  
20 sprouting of NPY fibers, concomitant upregulation of Y2 receptors, and downregulation of Y1 receptors in the hippocampus of patients with Ammon's horn sclerosis may be endogenous anticonvulsant mechanisms.

Rahmouni K, Haynes WG. Leptin signaling pathways in the central nervous system:  
25 interactions between neuropeptide Y and melanocortins. *Bioessays*. 2001 Dec;23(12):1095-9.

No other hormone has drawn more attention than leptin in recent studies on the control of appetite, body weight and obesity. This hormone is produced by adipose tissue and enters the brain via a saturable specific transport mechanism. Leptin acts in the hypothalamus to modulate food intake and heat production as well as several other neuroendocrine pathways.  
30 The mechanisms through which leptin exerts its central nervous effects are now better understood. Proopiomelanocortin- and neuropeptide Y-containing neurons in the hypothalamus have emerged as potent candidate mediators of leptin action. These two neuropeptides have been shown to exert opposing effects using different pathways. Recently, Cowley et al. (2001) described a new circuit in the regulation of neuronal activity by leptin

with an interaction between these two pathways. These data add complexity to the mechanisms by which leptin achieves its effects in the central nervous system, but they also offer potential mechanisms to explain the phenomenon of leptin resistance observed in obesity. Michalkiewicz M, Michalkiewicz T, Kreulen DL, McDougall SJ.

Increased blood pressure responses in neuropeptide Y transgenic rats. *Am J Physiol Regul Integr Comp Physiol* 2001 Aug;281(2):R417-26

10           Considering the coexistence of neuropeptide Y (NPY) and norepinephrine in perivascular sympathetic nerves and the known vasoconstrictor cooperation of NPY with norepinephrine, we investigated the involvement of NPY in long-term control of cardiovascular functions using NPY transgenic (NPY-tg) rats. These rats were developed by injection of the rat (Sprague-Dawley) pronuclei with a 14.5-kb clone of the rat structural NPY gene. When compared with nontransgenic littermates, NPY concentrations were significantly  
15           increased in a number of cardiovascular tissues of NPY-tg hemizygotes. Direct basal mean arterial pressure and heart rate were not changed, but calculated total vascular resistance was significantly increased in NPY-tg subjects. Arterial pressure increases, in response to norepinephrine injection, were greater in the NPY-tg rats. Also, the hypotension and bradycardia in response to hemorrhage were significantly reduced in NPY-tg subjects. These  
20           results indicate that NPY, when expressed in increased amounts, potentiates the pressor effects of norepinephrine and contributes to maintaining blood pressure during hemorrhage, but it does not alter resting blood pressure. These transgenic rats will facilitate studies of the role of NPY signaling in cardiovascular regulation, particularly regarding its functional cooperation with norepinephrine.

Horackova M, Slavikova J, Byczko Z. Postnatal development of the rat intrinsic cardiac nervous system: a confocal laser scanning microscopy study in whole-mount atria. *Tissue Cell* 2000 Oct;32(5):377-88

30           We used confocal laser scanning microscopy and fluorescent immunohistochemistry to study the developmental pattern and distribution of specific neuronal phenotypes within the intrinsic cardiac nervous system in whole-mount atrial preparations from newborn to 5 week old rats. Individual ganglia and neuronal cell bodies were localized by means of two general neuronal markers: protein gene product 9.5 (PGP) and microtubule-associated protein two (MAP). In rats < or =2 weeks old there were two main subpopulations of intrinsic neurons

located in the intraatrial septum and around the origin of the superior vena cava. The more abundant was a population of strongly tyrosine hydroxylase (TH) immunoreactive (IR) neurons (10-40 microm in diameter) most of which were also PGP-IR. The second, less numerous (approximately 60-70% than the TH-IR group) type of neurons exhibited ChAT-IR which colocalized with MAP-IR. Towards the end of the second postnatal week and during the third, the ganglia containing these neurons became more numerous and their localization also included tissues around the origins of the inferior vena cava and the pulmonary veins, as well as both atrial walls close to the AV junction. During the second and third postnatal weeks, when the extrinsic innervation of the adrenergic and cholinergic phenotypes largely increases, the intrinsic innervation also changed greatly, and around the 21st postnatal day it appeared to acquire mature characteristics. The TH-IR neurons changed their characteristics and formed two types of ganglia. The larger ganglia containing large cells (20-40 microm in diameter) expressed TH-IR mostly close to their inner body surface (approximately 80-90% of identified neurons). Most of these neurons also expressed neuropeptide Y (NPY)-IR, specifically around their nuclei. The second type of small strongly TH-IR neurons (approximately 10% of all identified neurons) were contained in smaller groups (20-50 cells) which were usually embedded into much larger ganglia (100-400 cells), containing large (20-50 microm) neurons. Unlike all other intrinsic neurons, these small TH-IR cells did not exhibit any PGP-IR or MAP-IR. The number of ChAT-IR neurons increased at this stage, reaching approximately 90% of the neurons identified by the general neuronal markers. These neurons were surrounded by a rich network of cholinergic varicose nerve fibers, some of which were likely of an extrinsic origin. We have also identified relatively small ganglia expressing immunoreactivity to vasoactive intestinal polypeptide (VIP), and to substance P (SP). The presented data indicate that the phenotypes of intrinsic neurons in the rat heart change greatly during the first month of postnatal development. This may be at least partially related to the development and maturation of functional extrinsic nervous control of the heart.

PMID: 11201277

**Panel 1.3D Summary:** Ag2930 The expression of the NOV9a gene was assessed in two independent runs on this panel. Low but significant levels of expression are seen in kidney cancer cells and a lung cancer cell, consistent with Panel 1.1. Please see the previous panel for discussion of utility of this gene in cancer.

The expression in this panel also confirms expression of this gene product in the brain. Please see Panel 1.1 for discussion of utility of this gene in the central nervous system.

**Panel 2D Summary:** Ag2930 The NOV9a gene is expressed at low but significant levels in kidney cancer samples in this panel but not in the adjacent normal tissue samples (CTs=30-32). This expression is consistent with results in the preceding panels. This suggests that expression of this gene can be used as a diagnostic marker for the presence of kidney cancer. Furthermore, therapeutic inhibition of the gene product could potentially be used in the treatment of kidney cancer.

**Panel 3D Summary:** Ag2930 The NOV9a gene expression is restricted to NCI-N417, a small cell lung cancer cell line (CT=33.81). Expression of this gene can therefore be used for the diagnosis and treatment of this cancer.

**Panel 4D Summary:** Ag2930 Expression of the NOV9a gene is low/undetectable in all samples on this panel. (CTs>35). (Data not shown.)

#### NOV4b

Expression of gene NOV4b was assessed using the primer-probe set Ag2955, described in Table BA. Results of the RTQ-PCR runs are shown in Tables BB, BC and BD.

**Table BA. Probe Name Ag2955**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |

**General\_screening\_panel\_v1.4 Summary:** Ag2955 Highest expression of the NOV4b gene is seen in a pancreatic cancer cell line (CT=32.6). Low but significant levels of expression are also seen in melanoma, lung, brain, ovarian, breast and prostate cancer cell lines. Thus, expression of this gene might be used as a diagnostic marker for the presence of these cancers. Furthermore, therapeutic inhibition of this gene product may be useful in the treatment of melanoma, lung, brain, ovarian, breast and prostate cancers.

**Panel 1.3D Summary:** Ag2955 Highest expression of the NOV4b gene is seen in an ovarian cancer cell line, SK-OV-3, (CT=33.1). Low but significant levels of expression are also seen in melanoma, lung, brain and pancreatic cancer cell lines. Thus, expression of this gene might be used as a diagnostic marker for the presence of these cancers. Furthermore, therapeutic inhibition of this gene product may be useful in the treatment of melanoma, lung, brain, and pancreatic cancers.

**Panel 4D Summary:** Ag 2955 The NOV4b gene is expressed at low but significant levels in treated and untreated dermal fibroblasts and in the basophil cell line treated with PMA and ionomycin. The latter mimics the condition that leads to the degranulation and release of various mediators which contribute to the symptomatology of allergic diseases. This transcript encodes a claudin 6 like protein, a member of the Claudin tight junction family. The expression of this transcript could potentially be used as a marker for activated basophils and dermal fibroblasts. Furthermore, modulation of the activity or expression of this putative protein by antibodies may reduce the symptoms of patients suffering from allergic diseases asthma, ulcerative colitis, atopic diseases such as contact dermatitis and eczema, or inflammatory skin diseases.

### NOV3b

Expression of gene NOV3b was assessed using the primer-probe set Ag2957, described in Table CA. Results of the RTQ-PCR runs are shown in Tables CB, CC, CD and CE.

**Table CA. Probe Name Ag2957**

| Primers | Sequences                                       | Length | Start Position | SEQ ID NO: |

**General\_screening\_panel\_v1.4 Summary:** Ag2957 Expression of the NOV3b gene is restricted to placenta, fetal kidney and liver. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel. In addition, this gene shows no or very low expression in the cancer cell lines used in this panel. Thus, the absence of expression could potentially be used as a diagnostic marker for cancer.

**Panel 1.3D Summary:** Ag2957 Expression of the NOV3b gene is restricted to kidney, spinal cord and liver. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel. This gene encodes a putative claudin. Claudins are components of tight junction strands. Thus, this specific pattern of expression may indicate that this gene product is involved in the formation of TJ strands in these tissues.

Among the CNS regions on this panel, this tight junction protein is expressed only in the spinal cord and may be involved in the blood brain barrier in this region. This molecule may therefore be of utility in the treatment of spinal cord injury. Growth factors such as BDNF and NGF have been shown in animal models to enhance repair after spinal crush injury; however in the clinical condition it is hard to administer protein therapeutics due to the blood brain barrier. The selective downregulation of this molecule may therefore increase the amount of protein crossing the blood brain barrier in the spinal cord, while not hampering its function in the rest of the CNS.

In addition, this gene shows no or very low expression in the cancer cell lines used in this panel. Thus, the absence of expression could potentially be used as a diagnostic marker for cancer.

**Panel 2D Summary:** Ag2957 The NOV3b gene is consistently expressed in the normal kidney samples (CTs=32-33) but not in the adjacent kidney tumors. This result is in agreement with the expression in the previous panels. Thus, absence of expression of this gene could be used as a diagnostic marker for kidney cancer. Furthermore, therapeutic modulation of the function or expression of this gene may be a possible treatment for this cancer.

**Panel 4D Summary:** Ag2957 The expression of the NOV3b transcript is restricted to the thymus (CT=32.1) but not in T cells. Thus, expression of this transcript could be used as a marker for this tissue.

**NOV1a, NOV1d, NOV1c, and NOV1b**

Expression of gene NOV1a and variants NOV1d, NOV1c and NOV1b was assessed using the primer-probe sets Ag2954 and Ag2956, described in Tables DA and DB. Results of the RTQ-PCR runs are shown in Tables DC and DD.

Table DA. Probe Name Ag2954

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2954/Ag2956 Expression of the NOV11 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**General\_screening\_panel\_v1.4 Summary:** Ag2954 The NOV1a gene is expressed at a very low level or not at all in most of the cancer cell lines on this panel. Very low expression in cell lines from pancreatic, lung, breast and ovarian cancers suggests that it may be involved in these cancers.

Ag2956 This gene is a member of the claudin family of proteins, and is only expressed in the fetal brain. It may be involved in the process of axonal growth or targeting and synaptogenesis (specifically in the development of tight junctions between neurons and other cell types). Therefore, this gene product may be of therapeutic benefit in the treatment of neuronal loss in clinical conditions such as head trauma or stroke where increased compensatory synaptogenesis is desirable.

**Panel 1.3D Summary:** Ag2954/Ag2956 Expression of the NOV11 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2954/Ag 2956 Two experiments with two different sets of primers show low but significant levels of expression of this transcript in liver cirrhosis, dermal and lung fibroblasts and endothelium. Thus, the NOV11 transcript may serve as a marker for these tissues and play a role in maintaining the integrity of these tissues.

## NOV2

Expression of gene NOV2 was assessed using the primer-probe set Ag2958, described in Table EA. Results of the RTQ-PCR runs are shown in Table EB.

**Table EA. Probe Name Ag2958**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |

**Panel 1.3D Summary:** Ag2958 Expression of the NOV2 is restricted to the kidney (CT=31.8). In addition, this gene is expressed at higher levels in adult kidney when compared to expression in fetal kidney (CT value = 40). Thus, this gene product may be useful for the differentiation of adult and fetal kidney tissue. This highly specific expression pattern also suggests that this gene product may be a small molecule drug for the treatment of diseases of the kidney.

**Panel 4D Summary:** Ag2958 Expression of the NOV2 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

## 10 NOV10

Expression of gene NOV10, also known as CG55964-02, was assessed using the primer-probe set Ag2857, described in Table FA.

Table FA. Probe Name Ag2857

| Primers | Sequences                                   | Length | Start Position | SEQ ID NO: |
|---------|---------------------------------------------|--------|----------------|------------|
| Forward | 5'-catttgccagagatttcttttg-3'                | 22     | 300            | 1018       |
| Probe   | TET-5'-caaatgtggttattcactcattccagg-3'-TAMRA | 28     | 336            | 1019       |
| Reverse | 5'-agaaggatacccgattcaattg-3'                | 22     | 364            | 1020       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2857 Expression of the NOV10 gene is low/undetectable in all samples on this panel. (CTs>35). (Data not shown.)

5 **Panel 1.3D Summary:** Ag2857 Expression of the NOV10 gene is low/undetectable in all samples on this panel. (CTs>35). (Data not shown.)

**Panel 2.2 Summary:** Ag2857 Expression of the NOV10 gene is low/undetectable in all samples on this panel. (CTs>35). (Data not shown.)

10 **Panel 4D Summary:** Ag2857 Expression of the NOV10 gene is low/undetectable in all samples on this panel. (CTs>35). (Data not shown.)

## NOV11

Expression of gene NOV11 was assessed using the primer-probe set Ag2858, described in Table GA.

Table GA. Probe Name Ag2858

| Primers | Sequences                                   | Length | Start Position | SEQ ID NO: |
|---------|---------------------------------------------|--------|----------------|------------|
| Forward | 5'-cttaagtcagtcctggcagttg-3'                | 22     | 674            | 1021       |
| Probe   | TET-5'-aaattatttcagacctgcattctccca-3'-TAMRA | 26     | 716            | 1022       |
| Reverse | 5'-agaacacaaggacagcacagat-3'                | 22     | 743            | 1023       |

15

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2858 Expression of the NOV11 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

20 **Panel 1.3D Summary:** Ag2858 Expression of the NOV11 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

**Panel 2.2 Summary:** Ag2858 Expression of the NOV11 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

**Panel 4D Summary:** Ag2858 Expression of the NOV11 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

## NOV12

- 5 Expression of gene NOV12 was assessed using the primer-probe set Ag2867, described in Table HA. Results of the RTQ-PCR runs are shown in Tables HB and HC.

**Table HA. Probe Name Ag2867**

| Primers | Sequences                                   | Length | Start Position | SEQ ID NO: |
|---------|---------------------------------------------|--------|----------------|------------|
| Forward | 5'-gtcacaccttggtgactgcaa-3'                 | 20     | 176            | 1024       |
| Probe   | TET-5'-acttacttggtgagcagtgccatgcct-3'-TAMRA | 26     | 196            | 1025       |
| Reverse | 5'-cattggaaacctttcaggaaa-3'                 | 21     | 236            | 1026       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2867 The NOV12 gene represents a novel G-protein coupled receptor (GPCR) with expression in the brain. The GPCR family of receptors contains a large number of neurotransmitter receptors, including the dopamine, serotonin,  $\alpha$  and  $\beta$ -adrenergic, acetylcholine muscarinic, histamine, peptide, and metabotropic glutamate receptors. GPCRs are excellent drug targets in various neurologic and psychiatric diseases. All antipsychotics have been shown to act at the dopamine D2 receptor; similarly novel antipsychotics also act at the serotonergic receptor, and often the muscarinic and adrenergic receptors as well. While the majority of antidepressants can be classified as selective serotonin reuptake inhibitors, blockade of the 5-HT<sub>1A</sub> and  $\alpha$ <sub>2</sub> adrenergic receptors increases the effects of these drugs. The GPCRs are also of use as drug targets in the treatment of stroke. Blockade of the glutamate receptors may decrease the neuronal death resulting from excitotoxicity; furthermore the purinergic receptors have also been implicated as drug targets in the treatment of cerebral ischemia. The  $\beta$ -adrenergic receptors have been implicated in the treatment of ADHD with Ritalin, while the  $\alpha$ -adrenergic receptors have been implicated in memory. Therefore this gene may be of use as a small molecule target for the treatment of any of the described diseases.

In addition, this GPCR is found to be upregulated in the temporal cortex of Alzheimer's disease patients. Blockade of this receptor may be of use in the treatment of this disease and decrease neuronal death.

1. Adenosine, an ubiquitous neuromodulator, and its analogues have been shown to produce 'depressant' effects in animal models believed to be relevant to depressive disorders, while adenosine receptor antagonists have been found to reverse adenosine-mediated 'depressant' effect. 2. We have designed studies to assess whether adenosine A2A receptor antagonists, or genetic inactivation of the receptor would be effective in established screening procedures, such as tail suspension and forced swim tests, which are predictive of clinical antidepressant activity. 3. Adenosine A2A receptor knockout mice were found to be less sensitive to 'depressant' challenges than their wildtype littermates. Consistently, the adenosine A2A receptor blockers SCH 58261 (1 - 10 mg kg<sup>-1</sup>, i.p.) and KW 6002 (0.1 - 10 mg kg<sup>-1</sup>, p.o.) reduced the total immobility time in the tail suspension test. 4. The efficacy of adenosine A2A receptor antagonists in reducing immobility time in the tail suspension test was confirmed and extended in two groups of mice. Specifically, SCH 58261 (1 - 10 mg kg<sup>-1</sup>) and ZM 241385 (15 - 60 mg kg<sup>-1</sup>) were effective in mice previously screened for having high immobility time, while SCH 58261 at 10 mg kg<sup>-1</sup> reduced immobility of mice that were selectively bred for their spontaneous 'helplessness' in this assay. 5. Additional experiments were carried out using the forced swim test. SCH 58261 at 10 mg kg<sup>-1</sup> reduced the immobility time by 61%, while KW 6002 decreased the total immobility time at the doses of 1 and 10 mg kg<sup>-1</sup> by 75 and 79%, respectively. 6. Administration of the dopamine D2 receptor antagonist haloperidol (50 - 200 microg kg<sup>-1</sup> i.p.) prevented the antidepressant-like effects elicited by SCH 58261 (10 mg kg<sup>-1</sup> i.p.) in forced swim test whereas it left unaltered its stimulant motor effects. 7. In conclusion, these data support the hypothesis that A2A receptor antagonists prolong escape-directed behaviour in two screening tests for antidepressants. Altogether the results support the hypothesis that blockade of the adenosine A2A receptor might be an interesting target for the development of effective antidepressant agents.

Blier P. Pharmacology of rapid-onset antidepressant treatment strategies. *Clin Psychiatry* 2001;62 Suppl 15:12-7

Although selective serotonin reuptake inhibitors (SSRIs) block serotonin (5-HT) reuptake rapidly, their therapeutic action is delayed. The increase in synaptic 5-HT activates feedback mechanisms mediated by 5-HT<sub>1A</sub> (cell body) and 5-HT<sub>1B</sub> (terminal) autoreceptors, which, respectively, reduce the firing in 5-HT neurons and decrease the amount of 5-HT released per action potential resulting in attenuated 5-HT neurotransmission. Long-term treatment desensitizes the inhibitory 5-HT<sub>1</sub> autoreceptors, and 5-HT neurotransmission is enhanced. The time course of these events is similar to the delay of clinical action. The addition of pindolol, which blocks 5-HT<sub>1A</sub> receptors, to SSRI treatment decouples the feedback inhibition of 5-HT neuron firing and accelerates and enhances the antidepressant response. The neuronal circuitry of the 5-HT and norepinephrine (NE) systems and their connections to forebrain areas believed to be involved in depression has been dissected. The firing of 5-HT neurons in the raphe nuclei is driven, at least partly, by alpha<sub>1</sub>-adrenoceptor-mediated excitatory inputs from NE neurons. Inhibitory alpha<sub>2</sub>-adrenoceptors on the NE neuroterminals form part of a feedback control mechanism. Mirtazapine, an antagonist at alpha<sub>2</sub>-adrenoceptors, does not enhance 5-HT neurotransmission directly but disinhibits the NE activation of 5-HT neurons and thereby increases 5-HT neurotransmission by a mechanism that does not require a time-dependent desensitization of receptors. These neurobiological phenomena may underlie the apparently faster onset of action of mirtazapine compared with the SSRIs.

Tranquillini ME, Reggiani A. Glycine-site antagonists and stroke. *Expert Opin Investig Drugs* 1999 Nov;8(11):1837-1848

The excitatory amino acid, (S)-glutamic acid, plays an important role in controlling many neuronal processes. Its action is mediated by two main groups of receptors: the ionotropic receptors (which include NMDA, AMPA and kainic acid subtypes) and the metabotropic receptors (mGluR(1-8)) mediating G-protein coupled responses. This review focuses on the strychnine insensitive glycine binding site located on the NMDA receptor channel, and on the possible use of selective antagonists for the treatment of stroke. Stroke is a devastating disease caused by a sudden vascular accident. Neurochemically, a massive release of glutamate occurs in neuronal tissue; this overactivates the NMDA receptor, leading to increased intracellular calcium influx, which causes neuronal cell death through necrosis. NMDA receptor activation strongly depends upon the presence of glycine as a co-agonist. Therefore, the administration of a glycine antagonist can block overactivation of NMDA receptors, thus preserving neurones from damage. The glycine antagonists currently identified

can be divided into five main categories depending on their chemical structure: indoles, tetrahydroquinolines, benzoazepines, quinoxalinediones and pyrida-zinoquinolines.

Monopoli A, Lozza G, Forlani A, Mattavelli A, Ongini E. Blockade of adenosine A2A receptors by SCH 58261 results in neuroprotective effects in cerebral ischaemia in rats.

5 Neuroreport 1998 Dec 1;9(17):3955-9

Blockade of adenosine receptors can reduce cerebral infarct size in the model of global ischaemia. Using the potent and selective A2A adenosine receptor antagonist, SCH 58261, we assessed whether A2A receptors are involved in the neuronal damage following focal cerebral ischaemia as induced by occluding the left middle cerebral artery. SCH 58261 (0.01 mg/kg  
10 either i.p. or i.v.) administered to normotensive rats 10 min after ischaemia markedly reduced cortical infarct volume as measured 24 h later (30% vs controls,  $p < 0.05$ ). Similar effects were observed when SCH 58261 (0.01 mg/kg, i.p.) was administered to hypertensive rats (28% infarct volume reduction vs controls,  $p < 0.05$ ). Neuroprotective properties of SCH 58261 administered after ischaemia indicate that blockade of A2A adenosine receptors is a  
15 potentially useful biological target for the reduction of brain injury.

**Panel 1.3D Summary:** Ag2867 Results from one experiment with the NOV12 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

**Panel 2.2 Summary:** Ag2867 Results from one experiment with the NOV12 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

20 **Panel 4D Summary:** Ag2867 Expression of the NOV12 gene is widespread among samples in this panel, with highest expression in B lymphocytes stimulated with CD40L and IL-4 (CT=31.1).

This transcript is also highly expressed in activated B cells and primary resting Th1 and Th2 T cells. The expression of this transcript in PBMC treated with the B cell mitogen, PWM, confirms the importance of CG54575-01 gene expression in activated B cells. In  
25 addition, this transcript is also abundantly expressed on primary resting Th1 cells (to a lesser degree on primary resting Th2 cells). Therefore, it appears that this gene, encoding a GPCR homolog, is a potential new member of the chemokine receptor family. The expression of this protein in activated B cells suggests a role for this protein in their trafficking to appropriate  
30 sites where they can fully activate antigen specific T cells. Thus, the protein encoded by this gene is likely to participate in the development of immune or inflammatory reactions.

In addition, the high expression of this gene in the kidney suggests that the putative GPCR encoded for by this gene could allow cells within the kidney to respond to specific microenvironmental signals (For example, ref. 1). Therefore, antibody or small molecule

therapies designed with the protein encoded for by this gene could modulate kidney function and be important in the treatment of inflammatory or autoimmune diseases that affect the kidney, including lupus and glomerulonephritis.

Mark M.D., Wittemann S., Herlitze S. (2000) G protein modulation of recombinant P/Q-type calcium channels by regulators of G protein signalling proteins. J. Physiol. 528 Pt 1: 65-77.

1. Fast synaptic transmission is triggered by the activation of presynaptic Ca<sup>2+</sup> channels which can be inhibited by Gbetagamma subunits via G protein-coupled receptors (GPCR). Regulators of G protein signalling (RGS) proteins are GTPase-accelerating proteins (GAPs), which are responsible for >100-fold increases in the GTPase activity of G proteins and might be involved in the regulation of presynaptic Ca<sup>2+</sup> channels. In this study we investigated the effects of RGS2 on G protein modulation of recombinant P/Q-type channels expressed in a human embryonic kidney (HEK293) cell line using whole-cell recordings. 2. RGS2 markedly accelerates transmitter-mediated inhibition and recovery from inhibition of Ba<sup>2+</sup> currents (IBa) through P/Q-type channels heterologously expressed with the muscarinic acetylcholine receptor M2 (mAChR M2). 3. Both RGS2 and RGS4 modulate the prepulse facilitation properties of P/Q-type Ca<sup>2+</sup> channels. G protein reinhibition is accelerated, while release from inhibition is slowed. These kinetics depend on the availability of G protein alpha and betagamma subunits which is altered by RGS proteins. 4. RGS proteins unmask the Ca<sup>2+</sup> channel beta subunit modulation of Ca<sup>2+</sup> channel G protein inhibition. In the presence of RGS2, P/Q-type channels containing the beta2a and beta3 subunits reveal significantly altered kinetics of G protein modulation and increased facilitation compared to Ca<sup>2+</sup> channels coexpressed with the beta1b or beta4 subunit.

**Panel 1.3D Summary:** Ag2869 Expression of the NOV13a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

5

**Panel 2.2 Summary:** Ag2869 Expression of the NOV13a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2869 Expression of the NOV13a gene is widespread among the samples in this panel, with highest expression in the B cell line Ramos treated with ionomycin (CT=31.1). Lower but still significant levels of expression are seen in untreated Ramos B cells. B cells represent a principle component of immunity and contribute to the immune response in a number of important functional roles, including antibody production. For example, production of antibodies against self-antigens is a major component in autoimmune disorders such a systemic lupus erythematosus, with B cells playing a major role. Since B cells play an important role in autoimmunity, inflammatory processes and inflammatory cascades, therapeutic modulation of this gene product may reduce or eliminate the symptoms of patients suffering from asthma, allergies, chronic obstructive pulmonary disease, emphysema, Crohn's disease, ulcerative colitis, rheumatoid arthritis, psoriasis, osteoarthritis, and other autoimmune disorders including systemic lupus erythematosus.

Significant levels of expression are also seen in IL-4, IL-9, IL-13 and IFN gamma activated-NCI-H292 mucoepidermoid cells as well as untreated NCI-H292 cells. Moderate expression is also detected in both treated and untreated human pulmonary aortic endothelial cells. The expression of this gene in cells derived from or within the lung suggests that this gene may be involved in normal conditions as well as pathological and inflammatory lung disorders that include chronic obstructive pulmonary disease, asthma, allergy and emphysema.

#### NOV14

Expression of gene NOV14 was assessed using the primer-probe set Ag2870, described in Table JA. Results of the RTQ-PCR runs are shown in Tables JB and JC.

**Table JA. Probe Name Ag2870**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|

**Panel 1.3D Summary:** Ag2870 Expression of the NOV14 gene is restricted to a sample derived from a colon cancer cell line (CT=34.4). Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of colon cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of colon cancer.

**Panel 2.2 Summary:** Ag2870 Expression of the NOV14 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2870 Expression of the NOV14 gene is highest in the B cell line Ramos treated with ionomycin (CT=30.2). Lower but still significant levels of expression are seen in untreated Ramos B cells. B cells represent a principle component of immunity and contribute to the immune response in a number of important functional roles, including antibody production. For example, production of antibodies against self-antigens is a major component in autoimmune disorders such a systemic lupus erythematosus, with B cells playing a major role. Since B cells play an important role in autoimmunity, inflammatory processes and inflammatory cascades, therapeutic modulation of this gene product may reduce or eliminate the symptoms of patients suffering from asthma, allergies, chronic obstructive pulmonary disease, emphysema, Crohn's disease, ulcerative colitis, rheumatoid arthritis, psoriasis, osteoarthritis, and other autoimmune disorders including systemic lupus erythematosus.

Significant levels of expression are also seen in IL-4, IL-9, IL-13, IFN gamma activated and untreated NCI-H292 mucoepidermoid cells, IL-4, IL-9, IL-13 and IFN gamma activated lung fibroblasts, human pulmonary aortic endothelial cells (treated and untreated),

5 treated small airway epithelium and lung microvascular endothelial cells (treated and untreated). The expression of this gene in cells derived from or within the lung further suggests that this gene may be involved in normal conditions as well as pathological and inflammatory lung disorders that include chronic obstructive pulmonary disease, asthma, allergy and emphysema.

### NOV15a and NOV15b

Expression of gene NOV15a and variant NOV15b was assessed using the primer-probe set Ag2875, described in Table KA. Results of the RTQ-PCR runs are shown in Table KB.

**Table KA. Probe Name Ag2875**

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |

**Panel 1.3D Summary:** Ag2875 Results from one experiment with the NOV15a gene are not included. The amp plot indicates that there were experimental difficulties with this run.

**Panel 2.2 Summary:** Ag2875 Expression of the NOV15a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2875 Highest expression of the NOV15a is in anti-CD40 treated dendritic cells (CT=33.2), with much lower expression in untreated dendritic cells. Thus, this gene product may be important in dendritic cell activation. Significant expression of this gene is also seen in liver cirrhosis. This gene encodes a putative GPCR; therefore, antibodies or small molecule therapeutics could reduce or inhibit fibrosis that occurs in liver cirrhosis. In addition, antibodies to this putative GPCR could also be used for the diagnosis of liver cirrhosis. In addition, significant expression of this gene is seen in resting macrophages. The putative GPCR encoded for by this transcript may therefore be important in macrophage detection of chemokine gradients and trafficking into specific sites within a tissue and in activation. Antibody or protein therapeutics designed against the protein encoded for by this transcript could reduce or inhibit inflammation in asthma, emphysema, allergy, psoriasis, arthritis, or any other condition in which macrophage localization/activation is important.

#### NOV16A: Olfactory Receptor

Expression of gene NOV16a was assessed using the primer-probe set Ag2876, described in Table LA. Results of the RTQ-PCR runs are shown in Tables LB and LC.

**Table LA. Probe Name Ag2876**

**Panel 1.3D Summary:** Ag2876 Expression of the NOV16a gene is restricted to a sample derived from a breast cancer cell line (CT=32.5). Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of breast cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of breast cancer.

**Panel 4D Summary:** Ag2876 Significant expression of the NOV16a gene is detected in a liver cirrhosis sample (CT = 33.5). Furthermore, expression of this gene is not detected in normal liver in Panel 1.3D, suggesting that its expression is unique to liver cirrhosis. This gene encodes a putative GPCR; therefore, antibodies or small molecule therapeutics could reduce or inhibit fibrosis that occurs in liver cirrhosis. In addition, antibodies to this putative GPCR could also be used for the diagnosis of liver cirrhosis.

#### NOV17a and NOV17b

Expression of gene NOV17a and variant NOV17b was assessed using the primer-probe set Ag2969, described in Table MA. Results of the RTQ-PCR runs are shown in Tables MB and MC.

Table MA. Probe Name Ag2969

| Primers | Sequences                                     | Length | Start Position | SEQ ID NO: |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2969 The NOV17a gene represents a novel G-protein coupled receptor (GPCR) with expression in the brain. The GPCR family of

receptors contains a large number of neurotransmitter receptors, including the dopamine, serotonin,  $\alpha$  and  $\beta$ -adrenergic, acetylcholine muscarinic, histamine, peptide, and metabotropic glutamate receptors. GPCRs are excellent drug targets in various neurologic and psychiatric diseases. All antipsychotics have been shown to act at the dopamine D2 receptor; similarly  
5 novel antipsychotics also act at the serotonergic receptor, and often the muscarinic and adrenergic receptors as well. While the majority of antidepressants can be classified as selective serotonin reuptake inhibitors, blockade of the 5-HT<sub>1A</sub> and  $\alpha_2$  adrenergic receptors increases the effects of these drugs. The GPCRs are also of use as drug targets in the treatment of stroke. Blockade of the glutamate receptors may decrease the neuronal death resulting from  
10 excitotoxicity; further more the purinergic receptors have also been implicated as drug targets in the treatment of cerebral ischemia. The  $\beta$ -adrenergic receptors have been implicated in the treatment of ADHD with Ritalin, while the  $\alpha$ -adrenergic receptors have been implicated in memory. Therefore this gene may be of use as a small molecule target for the treatment of any of the described diseases.

15 In addition, this panel shows that this GPCR is upregulated in the temporal cortex of Alzheimer's disease patients. Therefore, blockade of this receptor may be of use in the treatment of this disease and decrease neuronal death.

20 JM. Adenosine A<sub>2A</sub> receptor antagonists are potential antidepressants: evidence based on pharmacology and A<sub>2A</sub> receptor knockout mice. *Br J Pharmacol* 2001 Sep;134(1):68-77
1. Adenosine, an ubiquitous neuromodulator, and its analogues have been shown to produce 'depressant' effects in animal models believed to be relevant to depressive disorders, while adenosine receptor antagonists have been found to reverse adenosine-mediated  
25 'depressant' effect. 2. We have designed studies to assess whether adenosine A<sub>2A</sub> receptor antagonists, or genetic inactivation of the receptor would be effective in established screening procedures, such as tail suspension and forced swim tests, which are predictive of clinical antidepressant activity. 3. Adenosine A<sub>2A</sub> receptor knockout mice were found to be less sensitive to 'depressant' challenges than their wildtype littermates. Consistently, the adenosine  
30 A<sub>2A</sub> receptor blockers SCH 58261 (1 - 10 mg kg<sup>-1</sup>, i.p.) and KW 6002 (0.1 - 10 mg kg<sup>-1</sup>, p.o.) reduced the total immobility time in the tail suspension test. 4. The efficacy of adenosine A<sub>2A</sub> receptor antagonists in reducing immobility time in the tail suspension test was confirmed and extended in two groups of mice. Specifically, SCH 58261 (1 - 10 mg kg<sup>-1</sup>) and ZM 241385 (15 - 60 mg kg<sup>-1</sup>) were effective in mice previously screened for having

high immobility time, while SCH 58261 at 10 mg kg<sup>-1</sup>) reduced immobility of mice that were selectively bred for their spontaneous 'helplessness' in this assay. 5. Additional experiments were carried out using the forced swim test. SCH 58261 at 10 mg kg<sup>-1</sup>) reduced the immobility time by 61%, while KW 6002 decreased the total immobility time at the doses of 1 and 10 mg kg<sup>-1</sup>) by 75 and 79%, respectively. 6. Administration of the dopamine D2 receptor antagonist haloperidol (50 - 200 microg kg<sup>-1</sup>) i.p.) prevented the antidepressant-like effects elicited by SCH 58261 (10 mg kg<sup>-1</sup>) i.p.) in forced swim test whereas it left unaltered its stimulant motor effects. 7. In conclusion, these data support the hypothesis that A2A receptor antagonists prolong escape-directed behaviour in two screening tests for antidepressants. Altogether the results support the hypothesis that blockade of the adenosine A2A receptor might be an interesting target for the development of effective antidepressant agents.

Blier P. Pharmacology of rapid-onset antidepressant treatment strategies. Clin Psychiatry 2001;62 Suppl 15:12-7

Although selective serotonin reuptake inhibitors (SSRIs) block serotonin (5-HT) reuptake rapidly, their therapeutic action is delayed. The increase in synaptic 5-HT activates feedback mechanisms mediated by 5-HT<sub>1A</sub> (cell body) and 5-HT<sub>1B</sub> (terminal) autoreceptors, which, respectively, reduce the firing in 5-HT neurons and decrease the amount of 5-HT released per action potential resulting in attenuated 5-HT neurotransmission. Long-term treatment desensitizes the inhibitory 5-HT<sub>1</sub> autoreceptors, and 5-HT neurotransmission is enhanced. The time course of these events is similar to the delay of clinical action. The addition of pindolol, which blocks 5-HT<sub>1A</sub> receptors, to SSRI treatment decouples the feedback inhibition of 5-HT neuron firing and accelerates and enhances the antidepressant response. The neuronal circuitry of the 5-HT and norepinephrine (NE) systems and their connections to forebrain areas believed to be involved in depression has been dissected. The firing of 5-HT neurons in the raphe nuclei is driven, at least partly, by alpha<sub>1</sub>-adrenoceptor-mediated excitatory inputs from NE neurons. Inhibitory alpha<sub>2</sub>-adrenoceptors on the NE neuroterminals form part of a feedback control mechanism. Mirtazapine, an antagonist at alpha<sub>2</sub>-adrenoceptors, does not enhance 5-HT neurotransmission directly but disinhibits the NE activation of 5-HT neurons and thereby increases 5-HT neurotransmission by a mechanism that does not require a time-dependent desensitization of receptors. These neurobiological phenomena may underlie the apparently faster onset of action of mirtazapine compared with the SSRIs.

Tranquillini ME, Reggiani A. Glycine-site antagonists and stroke. Expert Opin Investig Drugs 1999 Nov;8(11):1837-1848

The excitatory amino acid, (S)-glutamic acid, plays an important role in controlling many neuronal processes. Its action is mediated by two main groups of receptors: the ionotropic receptors (which include NMDA, AMPA and kainic acid subtypes) and the metabotropic receptors (mGluR(1-8)) mediating G-protein coupled responses. This review focuses on the strychnine insensitive glycine binding site located on the NMDA receptor channel, and on the possible use of selective antagonists for the treatment of stroke. Stroke is a devastating disease caused by a sudden vascular accident. Neurochemically, a massive release of glutamate occurs in neuronal tissue; this overactivates the NMDA receptor, leading to increased intracellular calcium influx, which causes neuronal cell death through necrosis. NMDA receptor activation strongly depends upon the presence of glycine as a co-agonist. Therefore, the administration of a glycine antagonist can block overactivation of NMDA receptors, thus preserving neurones from damage. The glycine antagonists currently identified can be divided into five main categories depending on their chemical structure: indoles, tetrahydroquinolines, benzoazepines, quinoxalinediones and pyrida-zinoquinolines.

Monopoli A, Lozza G, Forlani A, Mattavelli A, Ongini E. Blockade of adenosine A2A receptors by SCH 58261 results in neuroprotective effects in cerebral ischaemia in rats. *Neuroreport* 1998 Dec 1;9(17):3955-9

Blockade of adenosine receptors can reduce cerebral infarct size in the model of global ischaemia. Using the potent and selective A2A adenosine receptor antagonist, SCH 58261, we assessed whether A2A receptors are involved in the neuronal damage following focal cerebral ischaemia as induced by occluding the left middle cerebral artery. SCH 58261 (0.01 mg/kg either i.p. or i.v.) administered to normotensive rats 10 min after ischaemia markedly reduced cortical infarct volume as measured 24 h later (30% vs controls,  $p < 0.05$ ). Similar effects were observed when SCH 58261 (0.01 mg/kg, i.p.) was administered to hypertensive rats (28% infarct volume reduction vs controls,  $p < 0.05$ ). Neuroprotective properties of SCH 58261 administered after ischaemia indicate that blockade of A2A adenosine receptors is a potentially useful biological target for the reduction of brain injury.

**Panel 1.3D Summary:** Ag2878 Expression of the NOV17a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2878 Expression of the NOV17a gene is restricted to a few samples in this panel, with highest expression in the kidney (CT=33.1). Thus, the putative GPCR encoded for by this gene could allow cells within the kidney to respond to specific microenvironmental signals (For example, ref. 1). Therefore, antibody or small molecule therapies designed with the protein encoded for by this gene could modulate kidney function

and be important in the treatment of inflammatory or autoimmune diseases that affect the kidney, including lupus and glomerulonephritis.

Furthermore, significant levels of expression are also seen in the PMA and ionomycin treated basophil cell line KU-812. GPCR-type receptors are important in multiple  
5 physiological responses mediated by basophils (ref. 2). Therefore, antibody or small molecule therapies designed with the protein encoded for by this gene could also block or inhibit inflammation or tissue damage due to basophil activation in response to asthma, allergies, hypersensitivity reactions, psoriasis, and viral infections.

1. Fast synaptic transmission is triggered by the activation of presynaptic Ca<sup>2+</sup> channels which can be inhibited by Gbetagamma subunits via G protein-coupled receptors (GPCR). Regulators of G protein signalling (RGS) proteins are GTPase-accelerating proteins (GAPs), which are responsible for >100-fold increases in the GTPase activity of G proteins and might be involved in the regulation of presynaptic Ca<sup>2+</sup> channels. In this study we investigated the effects of RGS2 on G protein modulation of recombinant P/Q-type channels expressed in a human embryonic kidney (HEK293) cell line using whole-cell recordings. 2.  
15 RGS2 markedly accelerates transmitter-mediated inhibition and recovery from inhibition of Ba<sup>2+</sup> currents (IBa) through P/Q-type channels heterologously expressed with the muscarinic acetylcholine receptor M2 (mAChR M2). 3. Both RGS2 and RGS4 modulate the prepulse facilitation properties of P/Q-type Ca<sup>2+</sup> channels. G protein reinhibition is accelerated, while release from inhibition is slowed. These kinetics depend on the availability of G protein alpha and betagamma subunits which is altered by RGS proteins. 4. RGS proteins unmask the Ca<sup>2+</sup>  
20 channel beta subunit modulation of Ca<sup>2+</sup> channel G protein inhibition. In the presence of RGS2, P/Q-type channels containing the beta2a and beta3 subunits reveal significantly altered kinetics of G protein modulation and increased facilitation compared to Ca<sup>2+</sup> channels coexpressed with the beta1b or beta4 subunit.

2. Heinemann A., Hartnell A., Stubbs V.E., Murakami K., Soler D., LaRosa G., Askenase P.W., Williams T.J., Sabroe I. (2000) Basophil responses to chemokines are regulated by both sequential and cooperative receptor signaling. *J. Immunol.* 165: 7224-7233.

To investigate human basophil responses to chemokines, we have developed a sensitive assay that uses flow cytometry to measure leukocyte shape change as a marker of cell responsiveness. PBMC were isolated from the blood of volunteers. Basophils were identified as a single population of cells that stained positive for IL-3Ralpha (CDw123) and negative for HLA-DR, and their increase in forward scatter (as a result of cell shape change) in response to chemokines was measured. Shape change responses of basophils to chemokines were highly reproducible, with a rank order of potency: monocyte chemoattractant protein (MCP) 4 (peak at  $\approx$  eotaxin-2 = eotaxin-3  $>$  eotaxin  $>$  MCP-1 = MCP-3  $>$  macrophage-inflammatory protein-1alpha  $>$  RANTES = MCP-2 = IL-8. The CCR4-selective ligand macrophage-derived chemokine did not elicit a response at concentrations up to 10 nM. Blocking mAbs to CCR2 and CCR3 demonstrated that responses to higher concentrations ( $>$ 10 nM) of MCP-1 were mediated by CCR3 rather than CCR2, whereas MCP-4 exhibited a biphasic response consistent with sequential activation of CCR3 at lower concentrations and CCR2 at 10 nM MCP-4 and above. In contrast, responses to MCP-3 were blocked only in the presence of both mAbs, but not after pretreatment with either anti-CCR2 or anti-CCR3 mAb alone. These patterns of receptor usage were different from those seen for eosinophils and monocytes. We suggest that cooperation between CCRs might be a mechanism for preferential recruitment of basophils, as occurs in tissue hypersensitivity responses in vivo.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2970 The NOV17c gene represents a novel G-protein coupled receptor (GPCR) with expression in the brain. The GPCR family of receptors contains a large number of neurotransmitter receptors, including the dopamine,

serotonin,  $\alpha$  and  $\beta$ -adrenergic, acetylcholine muscarinic, histamine, peptide, and metabotropic glutamate receptors. GPCRs are excellent drug targets in various neurologic and psychiatric diseases. All antipsychotics have been shown to act at the dopamine D2 receptor; similarly novel antipsychotics also act at the serotonergic receptor, and often the muscarinic and  
5      adrenergic receptors as well. While the majority of antidepressants can be classified as selective serotonin reuptake inhibitors, blockade of the 5-HT<sub>1A</sub> and  $\alpha_2$  adrenergic receptors increases the effects of these drugs. The GPCRs are also of use as drug targets in the treatment of stroke. Blockade of the glutamate receptors may decrease the neuronal death resulting from excitotoxicity; further more the purinergic receptors have also been implicated as drug targets  
10     in the treatment of cerebral ischemia. The  $\beta$ -adrenergic receptors have been implicated in the treatment of ADHD with Ritalin, while the  $\alpha$ -adrenergic receptors have been implicated in memory. Therefore this gene may be of use as a small molecule target for the treatment of any of the described diseases.

In addition, this GPCR is upregulated in the temporal cortex of Alzheimer's disease  
15     patients. Therefore, blockade of this receptor may be of use in the treatment of this disease and decrease neuronal death.

El Yacoubi M, Ledent C, Parmentier M, Bertorelli R, Ongini E, Costentin J, Vaugeois JM. Adenosine A2A receptor antagonists are potential antidepressants: evidence based on  
20     pharmacology and A2A receptor knockout mice. *Br J Pharmacol* 2001 Sep;134(1):68-77

1. Adenosine, an ubiquitous neuromodulator, and its analogues have been shown to produce 'depressant' effects in animal models believed to be relevant to depressive disorders, while adenosine receptor antagonists have been found to reverse adenosine-mediated 'depressant' effect. 2. We have designed studies to assess whether adenosine A2A receptor  
25     antagonists, or genetic inactivation of the receptor would be effective in established screening procedures, such as tail suspension and forced swim tests, which are predictive of clinical antidepressant activity. 3. Adenosine A2A receptor knockout mice were found to be less sensitive to 'depressant' challenges than their wildtype littermates. Consistently, the adenosine A2A receptor blockers SCH 58261 (1 - 10 mg kg<sup>-1</sup>, i.p.) and KW 6002 (0.1 - 10 mg kg<sup>-1</sup>,  
30     p.o.) reduced the total immobility time in the tail suspension test. 4. The efficacy of adenosine A2A receptor antagonists in reducing immobility time in the tail suspension test was confirmed and extended in two groups of mice. Specifically, SCH 58261 (1 - 10 mg kg<sup>-1</sup>) and ZM 241385 (15 - 60 mg kg<sup>-1</sup>) were effective in mice previously screened for having high immobility time, while SCH 58261 at 10 mg kg<sup>-1</sup> reduced immobility of mice that were

selectively bred for their spontaneous 'helplessness' in this assay. 5. Additional experiments were carried out using the forced swim test. SCH 58261 at 10 mg kg<sup>-1</sup>) reduced the immobility time by 61%, while KW 6002 decreased the total immobility time at the doses of 1 and 10 mg kg<sup>-1</sup>) by 75 and 79%, respectively. 6. Administration of the dopamine D2 receptor antagonist haloperidol (50 - 200 microg kg<sup>-1</sup>) i.p.) prevented the antidepressant-like effects elicited by SCH 58261 (10 mg kg<sup>-1</sup>) i.p.) in forced swim test whereas it left unaltered its stimulant motor effects. 7. In conclusion, these data support the hypothesis that A2A receptor antagonists prolong escape-directed behaviour in two screening tests for antidepressants. Altogether the results support the hypothesis that blockade of the adenosine A2A receptor might be an interesting target for the development of effective antidepressant agents.

Blier P. Pharmacology of rapid-onset antidepressant treatment strategies. Clin Psychiatry 2001;62 Suppl 15:12-7

Although selective serotonin reuptake inhibitors (SSRIs) block serotonin (5-HT) reuptake rapidly, their therapeutic action is delayed. The increase in synaptic 5-HT activates feedback mechanisms mediated by 5-HT<sub>1A</sub> (cell body) and 5-HT<sub>1B</sub> (terminal) autoreceptors, which, respectively, reduce the firing in 5-HT neurons and decrease the amount of 5-HT released per action potential resulting in attenuated 5-HT neurotransmission. Long-term treatment desensitizes the inhibitory 5-HT<sub>1</sub> autoreceptors, and 5-HT neurotransmission is enhanced. The time course of these events is similar to the delay of clinical action. The addition of pindolol, which blocks 5-HT<sub>1A</sub> receptors, to SSRI treatment decouples the feedback inhibition of 5-HT neuron firing and accelerates and enhances the antidepressant response. The neuronal circuitry of the 5-HT and norepinephrine (NE) systems and their connections to forebrain areas believed to be involved in depression has been dissected. The firing of 5-HT neurons in the raphe nuclei is driven, at least partly, by alpha<sub>1</sub>-adrenoceptor-mediated excitatory inputs from NE neurons. Inhibitory alpha<sub>2</sub>-adrenoceptors on the NE neuroterminals form part of a feedback control mechanism. Mirtazapine, an antagonist at alpha<sub>2</sub>-adrenoceptors, does not enhance 5-HT neurotransmission directly but disinhibits the NE activation of 5-HT neurons and thereby increases 5-HT neurotransmission by a mechanism that does not require a time-dependent desensitization of receptors. These neurobiological phenomena may underlie the apparently faster onset of action of mirtazapine compared with the SSRIs.

Tranquillini ME, Reggiani A. Glycine-site antagonists and stroke. Expert Opin Investig Drugs 1999 Nov;8(11):1837-1848

The excitatory amino acid, (S)-glutamic acid, plays an important role in controlling many neuronal processes. Its action is mediated by two main groups of receptors: the ionotropic receptors (which include NMDA, AMPA and kainic acid subtypes) and the metabotropic receptors (mGluR(1-8)) mediating G-protein coupled responses. This review focuses on the strychnine insensitive glycine binding site located on the NMDA receptor channel, and on the possible use of selective antagonists for the treatment of stroke. Stroke is a devastating disease caused by a sudden vascular accident. Neurochemically, a massive release of glutamate occurs in neuronal tissue; this overactivates the NMDA receptor, leading to increased intracellular calcium influx, which causes neuronal cell death through necrosis. NMDA receptor activation strongly depends upon the presence of glycine as a co-agonist. Therefore, the administration of a glycine antagonist can block overactivation of NMDA receptors, thus preserving neurones from damage. The glycine antagonists currently identified can be divided into five main categories depending on their chemical structure: indoles, tetrahydroquinolines, benzoazepines, quinoxalinediones and pyrida-zinoquinolines.

Monopoli A, Lozza G, Forlani A, Mattavelli A, Ongini E. Blockade of adenosine A2A receptors by SCH 58261 results in neuroprotective effects in cerebral ischaemia in rats. Neuroreport 1998 Dec 1;9(17):3955-9

Blockade of adenosine receptors can reduce cerebral infarct size in the model of global ischaemia. Using the potent and selective A2A adenosine receptor antagonist, SCH 58261, we assessed whether A2A receptors are involved in the neuronal damage following focal cerebral ischaemia as induced by occluding the left middle cerebral artery. SCH 58261 (0.01 mg/kg either i.p. or i.v.) administered to normotensive rats 10 min after ischaemia markedly reduced cortical infarct volume as measured 24 h later (30% vs controls,  $p < 0.05$ ). **CNS\_neurodegeneration\_v1.0 Summary:** Ag2972 The NOV19a represents a novel G-protein coupled receptor (GPCR) with expression in the brain. The GPCR family of receptors contains a large number of neurotransmitter receptors, including the dopamine, serotonin,  $\alpha$  and  $\beta$ -adrenergic, acetylcholine muscarinic, histamine, peptide, and metabotropic glutamate receptors. GPCRs are excellent drug targets in various neurologic and psychiatric diseases. All antipsychotics have been shown to act at the dopamine D2 receptor; similarly novel antipsychotics also act at the serotonergic receptor, and often the muscarinic and adrenergic receptors as well. While the majority of antidepressants can be classified as selective serotonin reuptake inhibitors, blockade of the 5-HT<sub>1A</sub> and  $\alpha_2$  adrenergic receptors

increases the effects of these drugs. The GPCRs are also of use as drug targets in the treatment of stroke. Blockade of the glutamate receptors may decrease the neuronal death resulting from excitotoxicity; further more the purinergic receptors have also been implicated as drug targets in the treatment of cerebral ischemia. The b-adrenergic receptors have been implicated in the treatment of ADHD with Ritalin, while the a-adrenergic receptors have been implicated in memory. Therefore this gene may be of use as a small molecule target for the treatment of any of the described diseases.

- El Yacoubi M, Ledent C, Parmentier M, Bertorelli R, Ongini E, Costentin J, Vaugeois JM. Adenosine A2A receptor antagonists are potential antidepressants: evidence based on pharmacology and A2A receptor knockout mice. *Br J Pharmacol* 2001 Sep;134(1):68-77
1. Adenosine, an ubiquitous neuromodulator, and its analogues have been shown to produce 'depressant' effects in animal models believed to be relevant to depressive disorders, while adenosine receptor antagonists have been found to reverse adenosine-mediated 'depressant' effect. 2. We have designed studies to assess whether adenosine A2A receptor antagonists, or genetic inactivation of the receptor would be effective in established screening procedures, such as tail suspension and forced swim tests, which are predictive of clinical antidepressant activity. 3. Adenosine A2A receptor knockout mice were found to be less sensitive to 'depressant' challenges than their wildtype littermates. Consistently, the adenosine A2A receptor blockers SCH 58261 (1 - 10 mg kg<sup>-1</sup>, i.p.) and KW 6002 (0.1 - 10 mg kg<sup>-1</sup>, p.o.) reduced the total immobility time in the tail suspension test. 4. The efficacy of adenosine A2A receptor antagonists in reducing immobility time in the tail suspension test was confirmed and extended in two groups of mice. Specifically, SCH 58261 (1 - 10 mg kg<sup>-1</sup>) and ZM 241385 (15 - 60 mg kg<sup>-1</sup>) were effective in mice previously screened for having high immobility time, while SCH 58261 at 10 mg kg<sup>-1</sup> reduced immobility of mice that were selectively bred for their spontaneous 'helplessness' in this assay. 5. Additional experiments were carried out using the forced swim test. SCH 58261 at 10 mg kg<sup>-1</sup> reduced the immobility time by 61%, while KW 6002 decreased the total immobility time at the doses of 1 and 10 mg kg<sup>-1</sup> by 75 and 79%, respectively. 6. Administration of the dopamine D2 receptor antagonist haloperidol (50 - 200 microg kg<sup>-1</sup> i.p.) prevented the antidepressant-like effects elicited by SCH 58261 (10 mg kg<sup>-1</sup> i.p.) in forced swim test whereas it left unaltered its stimulant motor effects. 7. In conclusion, these data support the hypothesis that A2A receptor antagonists prolong escape-directed behaviour in two screening tests for antidepressants.

Altogether the results support the hypothesis that blockade of the adenosine A2A receptor might be an interesting target for the development of effective antidepressant agents.

Blier P. Pharmacology of rapid-onset antidepressant treatment strategies. Clin Psychiatry 2001;62 Suppl 15:12-7

5           Although selective serotonin reuptake inhibitors (SSRIs) block serotonin (5-HT) reuptake rapidly, their therapeutic action is delayed. The increase in synaptic 5-HT activates feedback mechanisms mediated by 5-HT1A (cell body) and 5-HT1B (terminal) autoreceptors, which, respectively, reduce the firing in 5-HT neurons and decrease the amount of 5-HT released per action potential resulting in attenuated 5-HT neurotransmission. Long-term  
10 treatment desensitizes the inhibitory 5-HT1 autoreceptors, and 5-HT neurotransmission is enhanced. The time course of these events is similar to the delay of clinical action. The addition of pindolol, which blocks 5-HT1A receptors, to SSRI treatment decouples the feedback inhibition of 5-HT neuron firing and accelerates and enhances the antidepressant response. The neuronal circuitry of the 5-HT and norepinephrine (NE) systems and their  
15 connections to forebrain areas believed to be involved in depression has been dissected. The firing of 5-HT neurons in the raphe nuclei is driven, at least partly, by alpha1-adrenoceptor-mediated excitatory inputs from NE neurons. Inhibitory alpha2-adrenoceptors on the NE neuroterminals form part of a feedback control mechanism. Mirtazapine, an antagonist at alpha2-adrenoceptors, does not enhance 5-HT neurotransmission directly but disinhibits the  
20 NE activation of 5-HT neurons and thereby increases 5-HT neurotransmission by a mechanism that does not require a time-dependent desensitization of receptors. These neurobiological phenomena may underlie the apparently faster onset of action of mirtazapine compared with the SSRIs.

Tranquillini ME, Reggiani A. Glycine-site antagonists and stroke. Expert Opin Investig  
25 Drugs 1999 Nov;8(11):1837-1848

          The excitatory amino acid, (S)-glutamic acid, plays an important role in controlling many neuronal processes. Its action is mediated by two main groups of receptors: the ionotropic receptors (which include NMDA, AMPA and kainic acid subtypes) and the metabotropic receptors (mGluR(1-8)) mediating G-protein coupled responses. This review  
30 focuses on the strychnine insensitive glycine binding site located on the NMDA receptor channel, and on the possible use of selective antagonists for the treatment of stroke. Stroke is a devastating disease caused by a sudden vascular accident. Neurochemically, a massive release of glutamate occurs in neuronal tissue; this overactivates the NMDA receptor, leading to increased intracellular calcium influx, which causes neuronal cell death through necrosis.

NMDA receptor activation strongly depends upon the presence of glycine as a co-agonist. Therefore, the administration of a glycine antagonist can block overactivation of NMDA receptors, thus preserving neurones from damage. The glycine antagonists currently identified can be divided into five main categories depending on their chemical structure: indoles,  
5 tetrahydroquinolines, benzoazepines, quinoxalinediones and pyrida-zinoquinolines.

Monopoli A, Lozza G, Forlani A, Mattavelli A, Ongini E. Blockade of adenosine A2A receptors by SCH 58261 results in neuroprotective effects in cerebral ischaemia in rats. Neuroreport 1998 Dec 1;9(17):3955-9

Blockade of adenosine receptors can reduce cerebral infarct size in the model of global  
10 ischaemia. Using the potent and selective A2A adenosine receptor antagonist, SCH 58261, we assessed whether A2A receptors are involved in the neuronal damage following focal cerebral ischaemia as induced by occluding the left middle cerebral artery. SCH 58261 (0.01 mg/kg either i.p. or i.v.) administered to normotensive rats 10 min after ischaemia markedly reduced cortical infarct volume as measured 24 h later (30% vs controls,  $p < 0.05$ ). Similar effects were  
15 observed when SCH 58261 (0.01 mg/kg, i.p.) was administered to hypertensive rats (28% infarct volume reduction vs controls,  $p < 0.05$ ). Neuroprotective properties of SCH 58261 administered after ischaemia indicate that blockade of A2A adenosine receptors is a potentially useful biological target for the reduction of brain injury.

**Panel 1.3D Summary:** Ag2972 Expression of the NOV19a gene is low/undetectable  
20 in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2972 Expression of the the NOV19a gene is restricted to a few samples in this panel, with highest expression in peripheral blood mononuclear cells (PBMC) treated with the B cell selective pokeweed mitogen. No significant levels of expression of the transcript are seen in PBMC that contain normal B cells. Therefore, the  
25 putative GPCR encoded by this gene could potentially be used diagnostically to identify activated B cells. In addition, the gene product could also potentially be used therapeutically in the treatment of diseases in which B cells are activated.

**Panel CNS\_1 Summary:** Ag2972 This panel confirms expression of the NOV19a gene in the brains of an independent group of subjects. Please see panel 1.3d for a discussion  
30 of utility of this gene in the central nervous system.

## NOV20

Expression of gene NOV20 was assessed using the primer-probe set Ag2973, described in Table PA. Results of the RTQ-PCR runs are shown in Tables PB and PC.

Table PA. Probe Name Ag2973

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2973 The NOV20 gene represents a novel G-protein coupled receptor (GPCR) with expression in the brain. The GPCR family of

receptors contains a large number of neurotransmitter receptors, including the dopamine, serotonin,  $\alpha$  and  $\beta$ -adrenergic, acetylcholine muscarinic, histamine, peptide, and metabotropic glutamate receptors. GPCRs are excellent drug targets in various neurologic and psychiatric diseases. All antipsychotics have been shown to act at the dopamine D2 receptor; similarly  
5 novel antipsychotics also act at the serotonergic receptor, and often the muscarinic and adrenergic receptors as well. While the majority of antidepressants can be classified as selective serotonin reuptake inhibitors, blockade of the 5-HT<sub>1A</sub> and  $\alpha_2$  adrenergic receptors increases the effects of these drugs. The GPCRs are also of use as drug targets in the treatment of stroke. Blockade of the glutamate receptors may decrease the neuronal death resulting from  
10 excitotoxicity; further more the purinergic receptors have also been implicated as drug targets in the treatment of cerebral ischemia. The  $\beta$ -adrenergic receptors have been implicated in the treatment of ADHD with Ritalin, while the  $\alpha$ -adrenergic receptors have been implicated in memory. Therefore this gene may be of use as a small molecule target for the treatment of any of the described diseases.

El Yacoubi M, Ledent C, Parmentier M, Bertorelli R, Ongini E, Costentin J, Vaugeois JM. Adenosine A2A receptor antagonists are potential antidepressants: evidence based on pharmacology and A2A receptor knockout mice. *Br J Pharmacol* 2001 Sep;134(1):68-77

1. Adenosine, an ubiquitous neuromodulator, and its analogues have been shown to  
20 produce 'depressant' effects in animal models believed to be relevant to depressive disorders, while adenosine receptor antagonists have been found to reverse adenosine-mediated 'depressant' effect. 2. We have designed studies to assess whether adenosine A2A receptor antagonists, or genetic inactivation of the receptor would be effective in established screening procedures, such as tail suspension and forced swim tests, which are predictive of clinical  
25 antidepressant activity. 3. Adenosine A2A receptor knockout mice were found to be less sensitive to 'depressant' challenges than their wildtype littermates. Consistently, the adenosine A2A receptor blockers SCH 58261 (1 - 10 mg kg<sup>-1</sup>, i.p.) and KW 6002 (0.1 - 10 mg kg<sup>-1</sup>, p.o.) reduced the total immobility time in the tail suspension test. 4. The efficacy of adenosine A2A receptor antagonists in reducing immobility time in the tail suspension test was  
30 confirmed and extended in two groups of mice. Specifically, SCH 58261 (1 - 10 mg kg<sup>-1</sup>) and ZM 241385 (15 - 60 mg kg<sup>-1</sup>) were effective in mice previously screened for having high immobility time, while SCH 58261 at 10 mg kg<sup>-1</sup> reduced immobility of mice that were selectively bred for their spontaneous 'helplessness' in this assay. 5. Additional experiments were carried out using the forced swim test. SCH 58261 at 10 mg kg<sup>-1</sup> reduced the

immobility time by 61%, while KW 6002 decreased the total immobility time at the doses of 1 and 10 mg kg<sup>-1</sup>) by 75 and 79%, respectively. 6. Administration of the dopamine D2 receptor antagonist haloperidol (50 - 200 microg kg<sup>-1</sup>) i.p.) prevented the antidepressant-like effects elicited by SCH 58261 (10 mg kg<sup>-1</sup>) i.p.) in forced swim test whereas it left unaltered its  
5 stimulant motor effects. 7. In conclusion, these data support the hypothesis that A2A receptor antagonists prolong escape-directed behaviour in two screening tests for antidepressants. Altogether the results support the hypothesis that blockade of the adenosine A2A receptor might be an interesting target for the development of effective antidepressant agents.

10 Blier P. Pharmacology of rapid-onset antidepressant treatment strategies. Clin Psychiatry 2001;62 Suppl 15:12-7

Although selective serotonin reuptake inhibitors (SSRIs) block serotonin (5-HT) reuptake rapidly, their therapeutic action is delayed. The increase in synaptic 5-HT activates feedback mechanisms mediated by 5-HT<sub>1A</sub> (cell body) and 5-HT<sub>1B</sub> (terminal) autoreceptors, which, respectively, reduce the firing in 5-HT neurons and decrease the amount of 5-HT  
15 released per action potential resulting in attenuated 5-HT neurotransmission. Long-term treatment desensitizes the inhibitory 5-HT<sub>1</sub> autoreceptors, and 5-HT neurotransmission is enhanced. The time course of these events is similar to the delay of clinical action. The addition of pindolol, which blocks 5-HT<sub>1A</sub> receptors, to SSRI treatment decouples the feedback inhibition of 5-HT neuron firing and accelerates and enhances the antidepressant  
20 response. The neuronal circuitry of the 5-HT and norepinephrine (NE) systems and their connections to forebrain areas believed to be involved in depression has been dissected. The firing of 5-HT neurons in the raphe nuclei is driven, at least partly, by alpha<sub>1</sub>-adrenoceptor-mediated excitatory inputs from NE neurons. Inhibitory alpha<sub>2</sub>-adrenoceptors on the NE neuroterminals form part of a feedback control mechanism. Mirtazapine, an antagonist at  
25 alpha<sub>2</sub>-adrenoceptors, does not enhance 5-HT neurotransmission directly but disinhibits the NE activation of 5-HT neurons and thereby increases 5-HT neurotransmission by a mechanism that does not require a time-dependent desensitization of receptors. These neurobiological phenomena may underlie the apparently faster onset of action of mirtazapine compared with the SSRIs.

30 Tranquillini ME, Reggiani A. Glycine-site antagonists and stroke. Expert Opin Investig Drugs 1999 Nov;8(11):1837-1848

The excitatory amino acid, (S)-glutamic acid, plays an important role in controlling many neuronal processes. Its action is mediated by two main groups of receptors: the ionotropic receptors (which include NMDA, AMPA and kainic acid subtypes) and the

metabotropic receptors (mGluR(1-8)) mediating G-protein coupled responses. This review focuses on the strychnine insensitive glycine binding site located on the NMDA receptor channel, and on the possible use of selective antagonists for the treatment of stroke. Stroke is a devastating disease caused by a sudden vascular accident. Neurochemically, a massive release of glutamate occurs in neuronal tissue; this overactivates the NMDA receptor, leading to increased intracellular calcium influx, which causes neuronal cell death through necrosis. NMDA receptor activation strongly depends upon the presence of glycine as a co-agonist. Therefore, the administration of a glycine antagonist can block overactivation of NMDA receptors, thus preserving neurones from damage. The glycine antagonists currently identified can be divided into five main categories depending on their chemical structure: indoles, tetrahydroquinolines, benzoazepines, quinoxalinediones and pyridazinoquinolines.

Monopoli A, Lozza G, Forlani A, Mattavelli A, Ongini E. Blockade of adenosine A2A receptors by SCH 58261 results in neuroprotective effects in cerebral ischaemia in rats. *Neuroreport* 1998 Dec 1;9(17):3955-9

Blockade of adenosine receptors can reduce cerebral infarct size in the model of global ischaemia. Using the potent and selective A2A adenosine receptor antagonist, SCH 58261, we assessed whether A2A receptors are involved in the neuronal damage following focal cerebral ischaemia as induced by occluding the left middle cerebral artery. SCH 58261 (0.01 mg/kg either i.p. or i.v.) administered to normotensive rats 10 min after ischaemia markedly reduced cortical infarct volume as measured 24 h later (30% vs controls,  $p < 0.05$ ). Similar effects were observed when SCH 58261 (0.01 mg/kg, i.p.) was administered to hypertensive rats (28% infarct volume reduction vs controls,  $p < 0.05$ ). Neuroprotective properties of SCH 58261 administered after ischaemia indicate that blockade of A2A adenosine receptors is a potentially useful biological target for the reduction of brain injury.

**Panel 1.3D Summary:** Ag2973 Expression of the NOV20 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 3D Summary:** Ag2973 Expression of the NOV20 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2973 Significant expression of the NOV20 gene is detected in a liver cirrhosis sample (CT = 32.7). Furthermore, expression of this gene is not detected in normal liver in Panel 1.3D, suggesting that its expression is unique to liver cirrhosis. This gene encodes a putative GPCR; therefore, antibodies or small molecule therapeutics could reduce or inhibit fibrosis that occurs in liver cirrhosis. In addition, antibodies to this putative GPCR could also be used for the diagnosis of liver cirrhosis.

**Panel CNS\_1 Summary:** Ag2973 Expression of the NOV20 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

### NOV16b

Expression of gene NOV16b was assessed using the primer-probe sets Ag2875 and Ag3010, described in Tables QA and QB. Results of the RTQ-PCR runs are shown in Table QC.

**Panel 1.3D Summary:** Ag2875/Ag3010 Results from two experiments with the NOV16b gene are not included. The amp plots indicate that there were experimental difficulties with these runs.

5 **Panel 2.2 Summary:** Ag2875 Expression of the NOV16b gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2875 Highest expression of the NOV15a is in anti-CD40 treated dendritic cells (CT=33.2), with much lower expression in untreated dendritic cells. Thus, this gene product may be important in dendritic cell activation. Significant expression of  
10 this gene is also seen in liver cirrhosis. This gene encodes a putative GPCR; therefore, antibodies or small molecule therapeutics could reduce or inhibit fibrosis that occurs in liver cirrhosis. In addition, antibodies to this putative GPCR could also be used for the diagnosis of liver cirrhosis. In addition, significant expression of this gene is seen in resting macrophages. The putative GPCR encoded for by this transcript may therefore be important in macrophage  
15 detection of chemokine gradients and trafficking into specific sites within a tissue and in activation. Antibody or protein therapeutics designed against the protein encoded for by this transcript could reduce or inhibit inflammation in asthma, emphysema, allergy, psoriasis, arthritis, or any other condition in which macrophage localization/activation is important. A second experiment with the probe/primer set Ag3010 shows low/undetectable expression in all  
20 samples on this panel (CTs>35). (Data not shown.)

NOV21a

Expression of gene NOV21a was assessed using the primer-probe sets Ag2963 and Ag1292, described in Tables RA and RB. Results of the RTQ-PCR runs are shown in Tables RC, RD and RE.

Table RA. Probe Name Ag2963

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2963 The NOV21a gene, a secretory protease homolog, appears to be downregulated in the temporal cortex of Alzheimer's disease patients when compared to non-demented controls. Up regulation of this protease may therefore be of use in the treatment of Alzheimer's, particularly because Alzheimer's disease is believed to result at least in part from the improper processing of proteins (APP, Tau). This protease may serve to lower the levels of these disease proteins and ameliorate the dementia/pathology associated with Alzheimer's.

**Panel 1.3D Summary:** Ag2963 The NOV21a gene, a putative secretory serine-protease, is widely expressed in this panel. Highest expression is in an ovarian cancer cell line (CT=32), with expression detected in all cancer cell lines in this panel. Thus, inhibition of the protease domain might lead to a decrease in cell survival and proliferation and serve as a small molecule target in cancer.

This gene product also has low levels of expression in pancreas, thyroid, pituitary, adipose, and adult and fetal types of heart, skeletal muscle and liver. Therefore, this serine protease-like gene product may be a small molecule target for the treatment of endocrine and metabolic diseases, including obesity and Types 1 and 2 diabetes.

The expression in this panel further confirms expression of this gene in the CNS. Please see CNS\_neurodegeneration for discussion of utility of this gene in the CNS.

**Panel 4D Summary:** Ag1292/Ag2693 The NOV21a transcript is expressed on most tissues in panel 4D. This widespread expression is consistent with the results in Panel 1.3D. This transcript encodes a serine protease like protein with potential enzymatic activity and may important in maintaining normal cellular functions in a number of tissues. Therefore, therapies designed with the protein encoded by this transcript could be important in regulating cellular viability or function.

**NOV22a**

Expression of gene NOV22a was assessed using the primer-probe set Ag2964, described in Table SA.

**Table SA. Probe Name Ag2964**

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |
|---------|------------------------------------------------|--------|----------------|------------|
| Forward | 5'-gaaatacgcaggaaggaaatct-3'                   | 22     | 473            | 1063       |
| Probe   | TET-5'-cgtgggcatcatagaccagaaaacct-3'-<br>TAMRA | 26     | 507            | 1064       |
| Reverse | 5'-ggtctgtgagggagaagtgtga-3'                   | 22     | 544            | 1065       |

5

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2964 Expression of the NOV22a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

**Panel 1.3D Summary:** Ag2964 Expression of the NOV22a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

**Panel 4D Summary:** Ag2964 Expression of the NOV22a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

15 **NOV23a**

Expression of gene NOV23a was assessed using the primer-probe set Ag2967, described in Table TA.

**Table TA. Probe Name Ag2967**

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |
|---------|------------------------------------------------|--------|----------------|------------|
| Forward | 5'-ctcaaggaggacttccgtaag-3'                    | 21     | 478            | 1066       |
| Probe   | TET-5'-atcttcctctgcagaaagccactgtg-3'-<br>TAMRA | 26     | 500            | 1067       |
| Reverse | 5'-agtgagtgaatggccgtaca-3'                     | 20     | 557            | 1068       |

20

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2967 Expression of the NOV23a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

**Panel 1.3D Summary:** Ag2967 Expression of the NOV23a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

**Panel 4D Summary:** Ag2967 Expression of the NOV23a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

#### NOV23a and NOV23b

Expression of gene NOV23a and variant NOV23b was assessed using the primer-probe set Ag2996, described in Table UA. Results of the RTQ-PCR runs are shown in Table UB.

10

**Table UA. Probe Name Ag2996**

| Primers | Sequences                               | Length | Start Position | SEQ ID NO: |
|---------|-----------------------------------------|--------|----------------|------------|
| Forward | 5'-cagaggttacgcctgaagt-3'               | 20     | 54             | 1069       |
| Probe   | TET-5'-ctcagatcctgggccaggcactg-3'-TAMRA | 23     | 77             | 1070       |
| Reverse | 5'-cagaaagaggtcctgctcatg-3'             | 21     | 113            | 1071       |

**Panel 1.3D Summary:** Ag2996 Results from one experiment with the NOV23a gene are not included. The amp plot indicates that there were experimental difficulties with this run.

**Panel 4D Summary:** Ag2996 Significant expression of the NOV23a gene is detected in a liver cirrhosis sample and normal lung tissue(CTs=33-35). Thus, antibodies to this protein product could potentially be used for the diagnosis of liver cirrhosis or as a marker of normal lung tissue. Furthermore, therapeutic modulation of the expression or function of this gene may reduce or inhibit fibrosis that occurs in liver cirrhosis.

#### NOV24a

Expression of gene NOV24a was assessed using the primer-probe set Ag2934, described in Table VA.

**Table VA. Probe Name Ag2934**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|
| Forward | 5'-gaatctaattccgcaggaaatg-3'               | 22     | 1645           | 1072       |
| Probe   | TET-5'-cgtgtttgccaaattctcagcggtta-3'-TAMRA | 26     | 1668           | 1073       |
| Reverse | 5'-tcttttcatgaacctcatttgc-3'               | 22     | 1714           | 1074       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2934 Expression of the NOV24a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 1.3D Summary:** Ag2934 Expression of the NOV24a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2934 Expression of the NOV24a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

#### NOV25

Expression of gene NOV25 was assessed using the primer-probe sets Ag2935 and Ag3039, described in Tables WA and WB. Results of the RTQ-PCR runs are shown in Tables WC, WD and WE.

Table WA. Probe Name Ag2935

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |
|---------|------------------------------------------------|--------|----------------|------------|
| Forward | 5'-ctggactctacctcggaaactt-3'                   | 22     | 88             | 1075       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2935/Ag3039 No differential expression of the NOV25 gene is detected between the postmortem brains of Alzheimer's diseased patients and those of non-demented controls. However, this panel confirms the

expression of this gene in the CNS. Please see panel 1.3D for a discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag2935/Ag3039 The expression of the NOV25 gene was assessed in two independent runs with good concordance between runs. Highest expression is seen in the testis (CTs=29). In addition, expression of this gene is extremely low in renal and brain cancer cell lines but is expressed in the normal brain and kidney tissues on this sample. Therefore, this gene may be used as a diagnostic marker for brain and kidney cancer and prostate tissue. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of brain and renal cancers.

This gene encodes a novel protein phosphatase expressed at moderate to low levels in the CNS that may therefore be a small molecule target for the treatment of neurologic diseases.

In addition, this gene is expressed at low levels in metabolic tissues including pancreas, adrenal, thyroid, pituitary, adult and fetal heart, and adipose. This novel protein phosphatase may be a small molecule target for the treatment of metabolic and endocrine disease, including obesity and Types 1 and 2 diabetes. This gene is also differentially expressed in fetal skeletal muscle (CT values = 32-33) when compared to expression in adult skeletal muscle (CT values = 35-40). Therefore, expression of this gene may also be useful for the differentiation of adult and fetal skeletal muscle.

**Panel 4D Summary:** Ag2935/Ag3039 Expression of the NOV25 gene is highest and almost exclusive to the thymus (CTs=29-30). Expression of this gene could be used to distinguish thymus from the other samples on this panel. The putative phosphatase encoded by this gene may play an important role in T cell development. Small molecule therapeutics designed against the protein encoded by this gene could therefore be utilized to modulate immune function (T cell development) and be important for organ transplant, AIDS treatment or post chemotherapy immune reconstitution.

#### NOV26a and NOV26b

Expression of gene NOV26a and variant NOV26b was assessed using the primer-probe set Ag2936, described in Table XA.

**Table XA. Probe Name Ag2936**

| Primers | Sequences                   | Length | Start Position | SEQ ID NO: |
|---------|-----------------------------|--------|----------------|------------|
| Forward | 5'-gttcctgctgtctggactttt-3' | 21     | 1              | 1081       |

|         |                                                |    |    |      |
|---------|------------------------------------------------|----|----|------|
| Probe   | TET-5'-cccactgagacgcagctgtattctgt-3'-<br>TAMRA | 26 | 27 | 1082 |
| Reverse | 5'-tcgccaaatcatatttcacact-3'                   | 22 | 57 | 1083 |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2936 Expression of the NOV26a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

- 5 **Panel 1.3D Summary:** Ag2936 Expression of the NOV26a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

- Panel 4D Summary:** Ag2936 Expression of the NOV26a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a  
10 high probability of a probe failure.

#### NOV24a and NOV24b

Expression of gene NOV24a and variant NOV24b was assessed using the primer-probe set Ag2966, described in Table YA. Results of the RTQ-PCR runs are shown in Tables YB and YC.

15

**Table YA. Probe Name Ag2966**

| Primers | Sequences                                    | Length | Start Position | SEQ ID NO: |
|---------|----------------------------------------------|--------|----------------|------------|

**Panel 1.3D Summary:** Ag2966 Two experiments both show that expression of the NOV24a gene, a sodium-glucose cotransporter homolog, is limited to the kidney (CTs=29). This restricted expression is in agreement with published data which has shown that secondary active transport of glucose in the kidney is mediated by sodium glucose cotransporter. (See ref. 1). Thus, expression of this gene could be used as a marker for kidney tissue. Furthermore, the protein product may be important for normal function of the kidney. Thus, therapeutic modulation of the expression or function of this protein may be useful in treating diseases that affect the kidney, including diabetes.

#### References:

Bissonnette P, Noel J, Coady MJ, Lapointe JY. Functional expression of tagged human Na<sup>+</sup>-glucose cotransporter in *Xenopus laevis* oocytes. *J Physiol* 1999 Oct 15;520 Pt 2:359-71

1. High-affinity, secondary active transport of glucose in the intestine and kidney is mediated by an integral membrane protein named SGLT1 (sodium glucose cotransporter).
- 5 Though basic properties of the transporter are now defined, many questions regarding the structure- function relationship of the protein, its biosynthesis and targeting remain unanswered. In order to better address these questions, we produced a functional hSGLT1 protein (from human) containing a reporter tag. 2. Six constructs, made from three tags (myc, haemagglutinin and poly-His) inserted at both the C- and N-terminal positions, were thus tested
- 10 using the *Xenopus* oocyte expression system via electrophysiology and immunohistochemistry. Of these, only the hSGLT1 construct with the myc tag inserted at the N-terminal position proved to be of interest, all other constructs showing no or little transport activity. A systematic comparison of transport properties was therefore performed between the myc-tagged and the untagged hSGLT1 proteins. 3. On the basis of both steady-state (affinities
- 15 for substrate (glucose) and inhibitor (phlorizin) as well as expression levels) and presteady-state parameters (transient currents) we conclude that the two proteins are functionally indistinguishable, at least under these criteria. Immunological detection confirmed the appropriate targeting of the tagged protein to the plasma membrane of the oocyte with the epitope located at the extracellular side. 4. The myc-tagged hSGLT1 was also successfully
- 20 expressed in polarized MDCK cells. alpha-Methylglucose uptake studies on transfected cells showed an exclusively apical uptake pathway, thus indicating that the expressed protein was correctly targeted to the apical domain of the cell. 5. These comparative studies demonstrate that the myc epitope inserted at the N-terminus of hSGLT1 produces a fully functional protein while other epitopes of similar size inserted at either end of the protein inactivated the final
- 25 protein.

PMID: 10523405

**Panel 2D Summary:** Ag2966 Expression of the NOV24a gene is predominantly limited to the kidney. This result is in agreement with the expression seen in Panel 1.3D.

**Panel 3D Summary:** Ag2966 Results from one experiment with the NOV24a gene are not included. The amp plot indicates that there were experimental difficulties with this run.

30

**Panel 4D Summary:** Ag2966 Expression of the NOV24a gene is predominantly found in normal tissue from thymus, lung, colon and kidney. This expression profile suggests that the protein product may be involved in glucose transport in these tissues. Therefore, therapeutic

modulation of the expression or function of this protein may be useful in treating diseases that affect these organs.

## NOV28

- 5 Expression of gene NOV28 was assessed using the primer-probe set Ag2891, described in Table ZA. Results of the RTQ-PCR runs are shown in Tables ZB, ZC, ZD and ZE.

**Table ZA. Probe Name Ag2891**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2891 The NOV28 gene is expressed at very low levels in the CNS. No differential expression is detected in the postmortem brains of Alzheimer's patients when compared with non-demented controls. The widespread expression in the brain however suggests that this gene may be of utility in the treatment of neurological diseases.

**Panel 1.3D Summary:** Ag2891 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the NOV28 gene in a lung cancer cell line and the brain (CTs=33-34). Significant expression is also seen in the testis and a cluster of lung cancer cell lines. Thus, expression of this gene could be used to differentiate these samples from other samples on this panel, and as a marker of testis tissue and lung cancer.

**Panel 2D Summary:** Ag2891 Expression of the NOV28 gene is limited to samples derived from kidney cancer (CTs=33-34). Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel and as a marker to detect the presence of kidney cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of kidney cancer.

**Panel 3D Summary:** Ag2891 Expression of the NOV28 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2891 The NOV28 transcript is expressed at low but significant levels in the colon and thymus (CTs=33-35). Thus, the transcript or the protein it encodes could be used for detection of these tissues. The protein encoded by this transcript may also play an important role in the normal homeostasis of these tissues. Therefore, therapeutics designed with the protein encoded by this transcript could be important for modulating T cell development in the thymus or maintaining or restoring normal function to these organs during inflammation due to inflammatory bowel disease in the colon.

#### 10 NOV29a

Expression of gene NOV29a was assessed using the primer-probe set Ag2892, described in Table AAA. Results of the RTQ-PCR runs are shown in Tables AAB, AAC, AAD and AAE.

**Table AAA. Probe Name Ag2892**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|
| Forward | 5'-ggcagctcgaaactttgac-3'                  | 19     | 171            | 1090       |
| Probe   | TET-5'-cagaaatccgaagacatgctccgaag-3'-TAMRA | 26     | 193            | 1091       |
| Reverse | 5'-gacaatggtgtccaggtcttgt-3'               | 22     | 240            | 1092       |

**Panel 1.3D Summary:** Ag2892 Highest expression of the NOV29a gene is seen in a lung cancer cell line (CT=32.7). Significant expression is also seen in a colon cancer cell line and the liver. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel and as a diagnostic marker for the presence of colon and lung cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of colon and lung cancers. Results from a second run with the same probe and primer set are not included because of a potential problem in one of the sample wells.

**Panel 2D Summary:** Ag2892 Expression of the NOV29a gene is restricted to liver derived tissue, with highest expression in normal liver tissue (CT=32.4). Significant expression is also seen in liver cancer samples. Thus, expression of this gene could be used to differentiate liver derived samples from other samples on this panel and from other tissue samples.

**Panel 3D Summary:** Ag2892 Highest expression of the NOV29a gene is seen in a lung cancer cell line (CT=31.4). Significant expression is also seen in a gastric cancer cell line. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel and as a diagnostic marker for the presence of gastric and lung cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of gastric and lung cancers.

**Panel 4D Summary:** Ag2892 Expression of the NOV29a gene is restricted to liver cirrhosis (CT=34.8). This liver specific expression is in agreement with the expression in Panels 1.3D and 2D. Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel, and as a marker of liver tissue.

NOV29c

Expression of gene NOV29c was assessed using the primer-probe set Ag2893, described in Table ABA. Results of the RTQ-PCR runs are shown in Tables ABB, ABC, ABD, ABE and ABF.

Table ABA. Probe Name Ag2893

| Primers | Sequences                                    | Length | Start Position | SEQ ID NO: |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2893 This panel does not show differential expression of the NOV29c gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for a discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag2893 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the NOV29c gene in a renal cancer cell line (CTs=28-30). Significant expression is also seen in a cluster of renal cancer cell lines. Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of renal cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of renal cancer.

This gene also is expressed at low, but significant levels in the brain. Expression of the NOV29C gene in the cerebral cortex suggests a role in CNS-specific processes. Homology to the tocopherol-associated protein (TAP) transcription factor suggests a role for NOV29C in tocopherol mediated gene transcription. Tocopherol is an essential vitamin involved in many CNS processes that may be mediated by both its antioxidant properties and ability to regulate

gene transcription via NOV29c. Genetic disruption of tocopherol processing results in tocopherol deficiency and CNS disorders such as ataxia and neurodegeneration. Agents that modulate NOV29c may thus have utility in the treatment of ataxia and neurodegenerative diseases.

5           **References:**

Yamauchi J, Iwamoto T, Kida S, Masushige S, Yamada K, Esashi T. Tocopherol-associated protein is a ligand-dependent transcriptional activator. *Biochem Biophys Res Commun* 2001 Jul 13;285(2):295-9

10           Vitamin E is a term that encompasses a group of potent, lipid-soluble, chain-breaking antioxidants. Structural analysis reveals that molecules having vitamin E activity include four isomers (alpha, beta, gamma, and delta) of both tocopherols and tocotrienols. Alpha-tocopherol has been shown to have the highest biological vitamin E activity in mammalian tissues based on fetal resorption assays, and it reverses vitamin E deficiency symptoms. Although the molecular functions fulfilled specifically by alpha-tocopherol have yet to be  
15           fully described, it is unlikely that they are limited to general antioxidant functions. Here we show the functional characterization of alpha-tocopherol associated protein, TAP, which displays significant sequence similarity to the alpha-tocopherol transfer protein. Ligand competition analysis showed that recombinant TAP binds to alpha-tocopherol but not to other isomers of tocopherols. Using GFP fusion protein expression system, we observed that TAP  
20           translocates from cytosol to nuclei in alpha-tocopherol-dependent fashion. Transient transfection experiment showed that TAP activates transcription of the reporter gene in alpha-tocopherol-dependent manner. These results suggest that the biological function of alpha-tocopherol is not only as an antioxidant but also as a transcriptional regulator of gene expression via association with a transcription factor TAP.

25           Yokota T, Igarashi K, Uchihara T, Jishage K, Tomita H, Inaba A, Li Y, Arita M, Suzuki H, Mizusawa H, Arai H. Delayed-onset ataxia in mice lacking alpha -tocopherol transfer protein: model for neuronal degeneration caused by chronic oxidative stress. *Proc Natl Acad Sci U S A* 2001 Dec 18;98(26):15185-90

30           alpha-Tocopherol transfer protein (alpha-TTP) maintains the concentration of serum alpha-tocopherol (vitamin E), one of the most potent fat-soluble antioxidants, by facilitating alpha-tocopherol export from the liver. Mutations of the alpha-TTP gene are linked to ataxia with isolated vitamin E deficiency (AVED). We produced a model mouse of AVED by deleting the alpha-TTP gene, which showed ataxia and retinal degeneration after 1 year of age. Because the brain alpha-TTP functions in maintaining alpha-tocopherol levels in the brain,

alpha-tocopherol was completely depleted in the alpha-TTP(-/-) mouse brain, and the neurological phenotype of alpha-TTP(-/-) mice is much more severe than that of wild-type mice when maintained on an alpha-tocopherol-deficient diet. Lipid peroxidation in alpha-TTP(-/-) mice brains showed a significant increase, especially in degenerating neurons. alpha-Tocopherol supplementation suppressed lipid peroxidation and almost completely prevented the development of neurological symptoms. This therapy almost completely corrects the abnormalities in a mouse model of human neurodegenerative disease. Moreover, alpha-TTP(-/-) mice may prove to be excellent animal models of delayed onset, slowly progressive neuronal degeneration caused by chronic oxidative stress.

10       **Panel 2D Summary:** Ag2893 Highest expression of the NOV29c gene is seen in a sample derived from a kidney cancer cell line (CT=29.5). In addition, this sample is more highly expressed in kidney cancer than in adjacent normal tissue. Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of kidney cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of kidney cancer.

15       **Panel 3D Summary:** Ag2893 Expression of the NOV29c gene is detected primarily in samples derived from kidney cancer cell lines (CTs=30). Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel and as a marker to detect the presence of kidney cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of kidney cancer.

20       **Panel 4D Summary:** Ag2893 The NOV29c transcript is expressed at low but significant levels in the lung and thymus and in lupus kidney and cirrhotic liver. Thus, the transcript or the protein it encodes could be used for detection of these tissues. The expression of this gene suggests that the protein encoded by this transcript may play an important role in the normal homeostasis of the thymus and lung tissues. Therefore, therapeutics designed with the protein encoded by this transcript could be important for modulating T cell development in the thymus and for maintaining or restoring normal function to these lung during inflammation due to diseases such as asthma and emphysema. Additionally, induction of this transcript in other tissues such as the kidney and liver may be detrimental and antagonistic therapies designed with the protein encoded for by this transcript could be important in the treatment of diseases of these tissues.

NOV24b

Expression of gene NOV24b was assessed using the primer-probe set Ag1688, described in Table ACA. Results of the RTQ-PCR runs are shown in Tables ACB, ACC and ACD.

Table ACA. Probe Name Ag1688

| Primers | Sequences                                    | Length | Start Position | SEQ ID NO: |

**Panel 1.3D Summary:** Ag1688 Expression of the NOV24b gene, a plasma kallikrein homolog, is significantly higher in liver (CTs=28) than in any other sample on this panel.

Thus, expression of this gene could be used as a marker of liver tissue. Plasma kallikrein is a  
5 serine protease that, among other roles, plays a part in blood coagulation, fibrinolysis, and complement activation and has been implicated in adipose differentiation by remodelling of the fibronectin-rich ECM of preadipocytes. Therefore, an antagonist to this gene product may be beneficial in the treatment of obesity.

#### References:

- 10 Hoover-Plow J, Yuen L. Plasminogen binding is increased with adipocyte differentiation. *Biochem.Biophys.Res.Comm.* (2001) 284, 389-394

The purpose of this study was to examine the role of the plasminogen system in the development of adipose tissue. Plasminogen binding capacity was determined in differentiated and undifferentiated cells from adipose tissue of plasminogen deficient mice and 3T3 cells, a  
15 well-characterized tissue culture model. In 3T3 cells, plasminogen binding was fivefold higher in differentiated cells compared to the undifferentiated cells. Inhibition of binding by carboxyl-terminal lysine analogs was similar for the differentiated and undifferentiated cells with tranexamic acid > EACA > lysine. The binding of plasminogen was concentration-dependent and approaches saturation in the both cell types. The number of plasminogen  
20 binding sites was tenfold higher in the differentiated compared to the undifferentiated cells. In isolated mature fat cells and stromal cell cultures from mouse adipose tissue, plasminogen binding was also higher in the differentiated mature fat cells and differentiated stromal cells compared to undifferentiated stromal cells. Plasminogen binding was elevated in the differentiated cells from the Plg<sup>-/-</sup> mice compared to cells from the WT mice. These results

suggest that the plasminogen system plays an important role in adipose tissue development.

Selvarajan S, Lund LR, Takeuchi T, Craik CS, Werb Z.A plasma kallikrein-dependent  
5 plasminogen cascade required for adipocyte differentiation. *Nature Cell Biol.* (2001) 3, 267-  
275.

Here we show that plasma kallikrein (PKal) mediates a plasminogen (Plg) cascade in  
adipocyte differentiation. Ecotin, an inhibitor of serine proteases, inhibits cell-shape change,  
adipocyte-specific gene expression, and lipid accumulation during adipogenesis in culture.  
10 Deficiency of Plg, but not of urokinase or tissue-type plasminogen activator, suppresses  
adipogenesis during differentiation of 3T3-L1 cells and mammary-gland involution. PKal,  
which is inhibited by ecotin, is required for adipose conversion, Plg activation and 3T3-L1  
differentiation. Human plasma lacking PKal does not support differentiation of 3T3-L1 cells.  
PKal is therefore a physiological regulator that acts in the Plg cascade during adipogenesis.  
15 We propose that the Plg cascade fosters adipocyte differentiation by degradation of the  
fibronectin-rich preadipocyte stromal matrix.

PMID: 11231576

**Panel 2D Summary: Ag1688** The expression of the NOV24b gene appears to be  
highest in a sample derived from a sample of normal liver tissue adjacent to a metastatic colon  
20 cancer CT=26.2). In addition, there is substantial expression in other samples of normal liver,  
and to a much lesser degree, malignant liver tissue. This liver specific expression is consistent  
with the expression seen in Panel 1.3D. Thus, the expression of this gene could be used to  
distinguish liver derived tissue from the other samples in the panel, and more specifically the  
expression of this gene could be used to distinguish normal liver from malignant liver tissue.  
25 Moreover, therapeutic modulation of this gene, through the use of small molecule drugs,  
protein therapeutics or antibodies might be of benefit in the treatment of liver cancer.

**Panel 5 Islet Summary: Ag1688** Expression of the NOV24b gene is limited to  
pancreatic islets and small intestines. Please see Panel 1.3 for discussion of utility of this gene  
in metabolic disease.

### 30 NOV30

Expression of gene NOV30 was assessed using the primer-probe set Ag2894,  
described in Table ADA. Results of the RTQ-PCR runs are shown in Tables ADB, ADC and  
ADD.

**Panel 1.3D Summary:** Ag2894 Expression of the NOV30 gene is restricted to the testis and a renal cancer cell line(CTs=33-35). Thus, expression of this gene could be used to differentiate these samples from other samples on this panel and as a marker for testis tissue and renal cancer.

**Panel 2D Summary:** Ag2894 Expression of the NOV30 gene is restricted to normal liver tissue (CTs=33-35). This gene encodes a ryudocan homolog. Ryudocan is a cell-surface

heparan sulfate proteoglycan, which is involved in regulation of blood coagulation, among other biological functions. Thus, based on its expression profile, expression of this gene could be used to identify liver tissue and to differentiate between normal and malignant liver.

Furthermore, this gene product may be involved in normal homeostasis of the liver. Thus,  
5 therapeutic modulation of the expression or function of this gene product may be effective in the treatment of liver disease and liver cancer.

Kojima T, Inazawa J, Takamatsu J, Rosenberg RD, Saito H. Human ryudocan core protein: molecular cloning and characterization of the cDNA, and chromosomal localization of  
10 the gene. *Biochem Biophys Res Commun* 1993 Feb 15;190(3):814-22

We have isolated a series of overlapping cDNA clones encoding a 2,628 bp transcript, which potentially codes for a 198 amino acid protein with predicted molecular mass of 21,641 daltons, for the human ryudocan core protein. The deduced core proteins of the human and the rat ryudocan have high structural conservation, particularly in the NH<sub>2</sub> and COOH terminus  
15 regions of the putative mature core protein, including the combined transmembrane/cytoplasmic domains with conserved positions of all 4 tyrosine groups and 3 conserved glycosaminoglycan chain attachment regions, which might serve important roles for biological function of ryudocan. A major 2.7 kb transcript was detected in all tissues tested, with relatively high levels of expression observed in mRNA from lung, liver, skeletal muscle  
20 and kidney. A minor 1.9 kb transcript was also observed in some of tissues, which would be caused by alternative polyadenylation. Human ryudocan gene has been localized on the chromosome 20q12 by fluorescence in situ hybridization.

PMID: 7916598

Kojima T. Molecular biology of ryudocan, an endothelial heparan sulfate proteoglycan.  
25 *Semin Thromb Hemost* 2000;26(1):67-73

Ryudocan is a type I integral membrane heparan sulfate proteoglycan, which was originally cloned from rat microvascular endothelial cells. We have cloned the cDNA of rat ryudocan. The deduced amino acids of ryudocan has homologous transmembrane and intracellular domains with syndecan but very distinct extracellular regions. We also cloned the  
30 human ryudocan cDNA, of which the gene localizes on the chromosome 20q12. To better understand the regulation of ryudocan expression, we have determined the structural organization of the human ryudocan gene. The human ryudocan gene extends approximately 24 kb and is divided into five exons that appear conserved in syndecan family members. The 5'-flanking sequences of the human ryudocan gene contain a variety of potential binding sites

for transcription factors and are capable of functioning as a promoter. We purified human ryudocan and evaluated its interactions with several extracellular ligands. It was found that basic fibroblast growth factor (bFGF), midkine, and tissue factor pathway inhibitor exhibited significant ryudocan bindings. Heparitinase, but not chondroitin ABC lyase treatment, destroyed those ryudocan bindings; thus, the heparan sulfate chains of ryudocan appear to be responsible for those bindings. Immunohistochemical analysis revealed that ryudocan is expressed in peripheral nerve tissues, fibrous connective tissues, and placental trophoblasts. These findings suggest that ryudocan may possess multiple biologic functions, such as bFGF modulation, neurite growth promotion, and anticoagulation, via heparan sulfate-binding effectors in the cellular microenvironment.

PMID: 10805285

**Panel 4D Summary:** Ag2894 Expression of the NOV30 gene is restricted to a sample derived from liver cirrhosis. This gene is also expressed in normal liver in panel 2D. This expression suggests that this protein product, a ryudocan homolog, is essential to liver function. Thus, expression of this gene could be used as a marker for liver derived tissue. Furthermore, therapeutic modulation of the expression or function of this gene product may be effective in the treatment of diseases that affect the liver, including liver cirrhosis.

### NOV31

Expression of gene NOV31 was assessed using the primer-probe set Ag2922, described in Table AEA. Results of the RTQ-PCR runs are shown in Table AEB.

**Table AEA. Probe Name Ag2922**

| Primers | Sequences                               | Length | Start Position | SEQ ID NO: |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2922 Expression of the NOV31 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 1.3D Summary:** Ag2922 Expression of the NOV31 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 2D Summary:** Ag2922 Results from one experiment with the NOV31 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

**Panel 4.1D Summary:** Ag2922 Expression of the NOV31 gene is restricted to normal thymus and kidney (CTs=32-33). Thus, expression of this gene could be used as a marker for kidney and thymic tissue.

**Panel 4D Summary:** Ag2922 Results from one experiment with the NOV31 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

**NOV36a and NOV36b**

Expression of gene NOV36a and variant NOV36b was assessed using the primer-probe sets Ag1136 and Ag2999, described in Tables AFA and AFB. Results of the RTQ-PCR runs are shown in Tables AFC, AFD, AFE and AFF.

Table AFA. Probe Name Ag1136

**CNS\_neurodegeneration\_v1.0 Summary:** Ag1136 This panel does not show differential expression of the NOV36a gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag1136 Highest expression of the NOV36a gene, a cadherin 11 homolog, is seen in a glioma cell line U251 (CT=30.1). There is also low but significant expression in clusters of ovarian, lung, breast, kidney and colon cancer cell lines. Thus, expression of this gene could potentially be used as a diagnostic marker for these cancers. Furthermore, therapeutic inhibition of this gene product may be useful in the treatment of these cancers.

This gene also exhibits brain-preferential expression, indicating a role in CNS-specific processes. Recent research has shown that genetic deletion of cadherin-11 function acts to increase long term potentiation, a process thought to underlie learning and memory. Thus, drugs that target this gene product may have utility as memory enhancing drugs. Such drugs would have utility in treatment of CNS disorders involving memory dysfunction, including Alzheimer's disease and normal aging. In behavioral tests, Cadherin 11 deletion mutant mice show reduced fear- or anxiety-related responses. Thus, inhibitory agents targeting this gene product may also have utility as sedatives or anxiolytic agents for the treatment of CNS disorders including anxiety.

Among tissues with metabolic function, this gene has low levels of expression in pancreas, adrenal, thyroid, pituitary, adult and fetal heart, and adipose. Thus, this cadherin-like gene product may be important in the pathogenesis, diagnosis, and/or treatment of metabolic and endocrine disease, including obesity and Types 1 and 2 diabetes. Decreased levels of cadherin have been associated with decreased insulin secretion, suggesting that increasing cadherin levels may be a potent therapeutic for Type 2 diabetes. In addition, this gene is expressed at higher levels in fetal (CT=34) vs adult skeletal muscle (CT=40) and may be useful for differentiation between the two sources of tissue. Ag2999 Results from one experiment with the CG56003-01 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

- Cadherins organize symmetrical junctions between the pre- and postsynaptic membranes in central synapses. One of them, cadherin-11 (cad11), is expressed in the limbic system of the brain, most strongly in the hippocampus. Immunohistochemical studies of the hippocampus showed that cad11 proteins were densely distributed in its synaptic neuropil zones; in cultured hippocampal neurons, their distribution often overlapped with that of synaptophysin, and also occasionally with that of GluR1 at spines. To assess the role of cad11 in synaptic formation and/or function, we analyzed brains of cad11-deficient mice. In these mice, long-term potentiation (LTP) in the CA1 region of the hippocampus was, unexpectedly, enhanced; and the level of LTP saturation was increased. In behavioral tests, the mutant mice showed reduced fear- or anxiety-related responses. These results suggest that the cad11-

mediated junctions may modulate synaptic efficacy, confining its dynamic changes to a limited range, or these junctions are required for normal development of synaptic organization in the hippocampus.

Overexpression of Dominant-Negative Mutant Hepatocyte Nuclear Factor-1alpha in Pancreatic beta-Cells Causes Abnormal Islet Architecture With Decreased Expression of E-Cadherin, Reduced beta-cell Proliferation, and Diabetes. Diabetes. 10 2002 Jan;51(1):114-23.

One subtype of maturity-onset diabetes of the young (MODY)-3 results from mutations in the gene encoding hepatocyte nuclear factor (HNF)-1alpha. We generated transgenic mice expressing a naturally occurring dominant-negative form of human HNF-1alpha (P291fsinsC) in pancreatic beta-cells. A progressive hyperglycemia with age was seen 15 in these transgenic mice, and the mice developed diabetes with impaired glucose-stimulated insulin secretion. The pancreatic islets exhibited abnormal architecture with reduced expression of glucose transporter (GLUT2) and E-cadherin. Blockade of E-cadherin-mediated cell adhesion in pancreatic islets abolished the glucose-stimulated increases in intracellular Ca(2+) levels and insulin secretion, suggesting that loss of E-cadherin in beta-cells is 20 associated with impaired insulin secretion. There was also a reduction in beta-cell number (50%), proliferation rate (15%), and pancreatic insulin content (45%) in 2-day-old transgenic mice and a further reduction in 4-week-old animals. Our findings suggest various roles for HNF-1alpha in normal glucose metabolism, including the regulation of glucose transport, beta-cell growth, and beta-cell-to-beta-cell communication.

**Panel 2D Summary:** Ag1136 The NOV36a gene is a good target for ovarian, gastric, breast, lung, colon, uterine and kidney cancers because it is expressed at a higher level in these cancers than the adjacent normal tissue. Therefore, expression of this gene could potentially be used as a diagnostic marker for these cancers and therapeutic inhibition may be useful in 30 treatment of these cancers.

**Panel 4D Summary:** Ag1136/Ag2999 Two experiments produce results that are in excellent agreement. The NOV36A transcript is expressed at low levels in hematopoietic cells and at higher levels in endothelial cells. IL-1 beta and TNFalpha treatment reduce transcript levels consistently in endothelium samples including HPAEC, HUVEC and lung

microvascular EC. Fibroblasts also express this transcript and dermal fibroblasts down regulate expression in response to IL-1 beta, gamma interferon and IL-4. This transcript encodes a putative cadherin 11 like molecule. Cadherins are adhesion molecules that regulate normal homeostasis. Loss of cadherin 11 expression can reduce the expression of factors such as VEGF-D in fibroblasts (see reference 1). Therapies designed with the protein encoded by this transcript could be important in the regulating endothelium function including leukocyte extravasation, a major component of inflammation during asthma, IBD, and psoriasis. Therapeutics designed with the protein encoded by this transcript could also be important in the treatment of osteoarthritis and osteoporosis since this protein may be important in maintaining bone density (see reference 2).

Orlandini M, Oliviero S In fibroblasts Vegf-D expression is induced by cell-cell contact mediated by cadherin-11. J Biol Chem 2001 Mar 2;276(9):6576-81

Vascular endothelial growth factors (VEGFs) are a highly conserved family of growth factors all angiogenic in vivo with mitogenic and chemotactic activity on endothelial cells. VEGFs are expressed in fibroblasts either in hypoxia or in response to growth factors. Here we report that, differently from the other members of the family, Vegf-D is induced by cell-cell contact. By in situ hybridization we demonstrated that noninteracting fibroblasts express low levels of Vegf-D mRNA, whereas contacting cells express high levels of Vegf-D transcripts. By immunostaining we observed that the surface protein cadherin-11 is localized at the opposite sites of interacting cell surfaces. Ca(2+) deprivation from the culture medium determined the loss of cadherin-11 from the cell surfaces and down-regulation of Vegf-D mRNA. Moreover, a cadherin-11 antisense RNA construct inhibited Vegf-D expression in confluent BALB/c fibroblasts, whereas in NIH 3T3 cells, which express low levels of cadherin-11, Vegf-D induction could be obtained by overexpression of cadherin-11. This suggests that cell interaction mediated by cadherin-11 induces the expression of the angiogenic factor Vegf-D in fibroblasts.

Kawaguchi J, Azuma Y, Hoshi K, Kii I, Takeshita S, Ohta T, Ozawa H, Takeichi M, Chisaka O, Kudo A. Targeted disruption of cadherin-11 leads to a reduction in bone density in calvaria and long bone metaphyses. J Bone Miner Res 2001 Jul;16(7):1265-71

The migration and adhesion of osteoblasts requires several classical cadherins. Cadherin-11, one of the classical cadherins, was expressed in mouse osteoblasts in skull bone and femur, revealed by immunohistochemistry. To elucidate the function of cadherin-11 in

osteoblastogenesis, cadherin-11 null mutant mice were investigated. Although apparently normal at birth, Alizarin red staining of null mutant mice showed a reduced calcified area at the frontal suture that caused a round-shaped calvaria with increasing animal age to 3 months. Consequently, there was a reduction in bone density at the femoral metaphyses and the diploe of calvaria in null mutant mice. In the in vitro culture of newborn calvarial cells, the calcified area of mutant cells was smaller than those derived from wild-type littermates. These results show that absence of cadherin-11 leads to reduced bone density in some parts of skeletons including calvaria and long bone metaphyses, and thus suggest that cadherin-11 plays roles in the regulation of osteoblast differentiation and in the mineralization of the osteoid matrix.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag047/Ag2679/Ag2728 This panel does not show differential expression of the NOV37 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1 for discussion of utility of this gene in the central nervous system.

**Panel 1 Summary:** Ag047/Ag332/Ag47b Multiple experiments with three different probe and primer sets produce results that are in excellent agreement, with highest expression of the NOV37 gene in a brain cancer cell line (CT=23-25). There is also significant expression in clusters of samples from melanoma, ovarian cancer, breast, lung, renal colon and brain cancer lines. Thus, expression of this gene may be associated with these forms of cancer and could potentially be used as a diagnostic marker for the presence of these cancers. Furthermore, therapeutic modulation of the expression or function of these genes may be useful in the treatment of ovarian, breast, lung, renal, and brain cancer and melanoma.

In addition to significant expression in brain cancer cell lines, this gene is preferentially expressed in the brain. This expression profile suggests that this gene product may play a role in CNS processes. This gene encodes a homolog of a member of the neurexin family, Ten M2, and may play a role in neuronal regeneration. Thus, agents that induce the expression or activity of NOV37 may have utility as neuronal regeneration drugs. Such agents would have utility in neurodegenerative diseases, stroke, and neuronal trauma.

Among tissues with metabolic function, this gene shows consistent expression in thyroid, adult and fetal heart, liver and skeletal muscle. Thus, this gene product may be an antibody target for the treatment of metabolic and endocrine disease, including obesity and Types 1 and 2 diabetes. In addition, this gene is expressed at higher levels in adult liver than in fetal liver and may be useful for differentiating between the two sources of liver tissue.

Otaki JM, Firestein S. Neurestin: putative transmembrane molecule implicated in neuronal development. Dev Biol 1999 Aug 1;212(1):165-81

We have cloned a novel cDNA encoding a putative transmembrane protein, neurestin, from the rat olfactory bulb. Neurestin was identified based on a sequence similar to that of the second extracellular loops of odorant receptors in the cysteine-rich CC box located immediately after EGF-like motifs. Neurestin shows homology to a neuregulin gene product, human gamma-heregulin, a Drosophila receptor-type pair-rule gene product, Odd Oz (Odz) / Ten(m), and Ten(a), suggesting a possible function in synapse formation and morphogenesis. Recently, a mouse neurestin homolog has independently been cloned as DOC4 from the NIH-3T3 cell line. Northern blot analysis showed that neurestin is highly expressed in the brain and also in other tissues at much lower levels. In situ hybridization studies showed that neurestin is expressed in many types of neurons, including pyramidal cells in the cerebral cortex and tufted cells in the olfactory bulb during development. In adults, neurestin is mainly expressed in olfactory and hippocampal granule cells, which are known to be generated throughout adulthood. Nonetheless, in adults the expression of neurestin was experimentally induced in external tufted cells during regeneration of olfactory sensory neurons. These results suggest a role for neurestin in neuronal development and regeneration in the central nervous system.

**Panels 1.1/1.2/1.3D Summary:** Ag047 The NOV37 gene is expressed in melanoma, ovarian cancer, breast, lung, renal and brain cancer lines with good concordance for 3 independent runs. Expression of this gene might be associated with these forms of cancer and therapeutic modulation of this gene might be of use in the treatment of these cancers. Please note that results from one experiment on Panel 1.3D with the probe/primer set Ag2975 are not included. The amp plot suggests that there were experimental difficulties with this run.

**Panel 2.2 Summary:** Ag2975 This gene appears to be expressed at a very low level in the samples used in this panel. Significant expression is only seen in lung, kidney and breast cancer samples. Expression of this gene might be associated with these forms of cancer and therapeutic modulation of this gene might be of use in the treatment of these cancers.

**Panel 2D Summary:** Ag047 The expression of the NOV37 gene was assessed in multiple runs on this panel, with excellent concordance between the runs. This gene appears to be expressed at a higher level in gastric, bladder, and 2 samples each of lung and kidney cancer when compared to the normal adjacent tissue. Thus, expression of this gene might be associated with these forms of cancer and therapeutic modulation of this gene might be of use in the treatment of these cancers.

**Panel 3D Summary:** Ag047 The NOV37 gene is expressed in squamous cell carcinoma, glioma, small cell lung cancer cell lines. Thus, expression of this gene might be associated with these cancers and therapeutic modulation of this gene might be of use in the treatment of these cancers.

- 5       **Panels 4D/4.1D Summary:** Ag047/Ag2679/Ag2728/Ag2975/Ag047b Multiple runs with different set of primers give very consistent expression data. Highest expression of the NOV37 transcript is found in small airway epithelium upon treatment with TNF- $\alpha$  and IL-1 (CT=25). This expression is significantly up-regulated when compared to untreated tissue (CT=28). Moderate expression of this transcript is also found in keratinocytes and astrocytes.
- 10   NOV37 encodes for a neurestin like molecule whose role in neuronal regeneration has been demonstrated. Therefore, the putative protein encoded by NOV37 may play an important role in the regeneration or repair mechanism of these tissues in inflammation. Thus, therapeutic modulation of the expression of this gene product may be beneficial for the treatment of inflammatory lung diseases such as bronchitis, chronic obstructive pulmonary disease,
- 15   emphysema. Therapeutics designed against this putative protein may also be useful for in the CNS for reducing inflammation, including inflammation that results from multiple sclerosis or stroke.

#### NOV38, NOV39a, and NOV39b

- 20       Expression of gene NOV38 and variants NOV39a and NOV39b was assessed using the primer-probe set Ag3753, described in Table AHA. Results of the RTQ-PCR runs are shown in Tables AHB and AHC.

**Table AHA. Probe Name Ag3753**

| Primers | Sequences                                   | Length | Start Position | SEQ ID NO: |

**General screening panel v1.4 Summary:** Ag3753 Results from one experiment with the NOV38 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

- 5 **Panel 4.1D Summary:** Ag3753 Highest expression of the NOV38 transcript is found in Ramos B cell line activated with PMA and ionomycin (CT=29). However, expression is not seen in primary activated B cells. Therefore, expression of this gene could potentially be used as a marker for activated B lymphoma. This gene is also expressed at lower levels in liver cirrhosis, lung fibroblasts and kidney. This transcript encodes for a molecule that belongs to
- 10 the activin family, a member of the TGF beta superfamily. These factors influence growth and differentiation and are present in many cells and tissues. Therefore, therapeutics using the protein encoded by NOV38 could be important for the normal homeostasis of these tissues.

#### NOV40

- 15 Expression of gene NOV40 was assessed using the primer-probe set Ag2907, described in Table AIA. Results of the RTQ-PCR runs are shown in Tables AIB, AIC, AID and AIE.

**Table AIA. Probe Name Ag2907**

| Primers | Sequences                                 | Length | Start Position | SEQ ID NO: |

**Panel 1.3D Summary:** Ag2907 Results from two experiments with the same probe/primer set are in good agreement. Expression of the NOV40 gene is highest in a sample derived from pituitary tissue with little to no expression detected in any other tissue. Thus,  
 5 expression of this gene could be used to distinguish pituitary gland from the other samples on this panel.

The protein encoded for by this gene is most homologous to a glucuronosyltransferase, normally found in liver. UDP glycosyltransferases (UGT) are a superfamily of enzymes that catalyze the addition of the glycosyl group from a UTP-sugar to a small hydrophobic  
 10 molecule. Glucuronosyltransferases are membrane-bound microsomal enzymes that catalyze the transfer of glucuronic acid to a wide variety of exogenous and endogenous lipophilic substrates. These enzymes are of major importance in the detoxification and subsequent elimination of xenobiotics such as drugs and carcinogens. The pituitary plays a major role in the physiology of many different systems in the body. Therefore, this gene may play an  
 15 essential role in maintaining proper function of the pituitary gland and many of its secreted peptides. Furthermore, therapeutic modulation of the activity of this gene or its protein product using small molecule drugs may be useful for the treatment of diabetes and diabetes as well as growth, reproductive, and endocrine disorders.

**Panel 2D Summary:** Ag2907 Expression of the NOV40 gene is highest and almost  
 20 exclusive to a sample derived from a prostate cancer (CT = 31.7). Thus, the expression of this gene could be used to distinguish prostate cancer from the other samples in the panel. Moreover, therapeutic modulation of the activity of this gene or its protein product, through the use of small molecule drugs, protein therapeutics or antibodies, might be of benefit in the treatment of prostate cancer.

**Panel 3D Summary:** Ag2907 Expression of the NOV40 gene is highest in a sample  
 25 derived from a squamous cell carcinoma cell line (CT = 33.8). Thus, the expression of this gene could be used to distinguish this sample from the other samples in the panel.

**Panel 4D Summary:** Ag2907 Expression of the NOV40 gene is detected at a very low level in small airway epithelium treated with the inflammatory cytokines TNF- $\alpha$  and IL-1 $\beta$  (CT = 34.2). Thus, expression of this gene may be a marker of inflammation in the lung.

#### NOV41a and NOV41b

- 5 Expression of gene NOV41a and variant NOV41b was assessed using the primer-probe sets Ag1361 and Ag2953, described in Tables AJA and AJB. Results of the RTQ-PCR runs are shown in Tables AJC, AJD and AJE.

**Table AJA. Probe Name Ag1361**

**Panel 1.3D Summary:** Ag1361 Expression of the NOV41a gene is restricted to stomach (CT value = 29.9) and kidney (CT value = 32.9) tissue. This observation is consistent with the identification of this gene as a sodium/hydrogen ion exchanger because the function of both of these tissues requires sodium/hydrogen ion exchange activity. The inhibition of the NOV41A protein activity, through the use of antibodies or small molecule drugs, might be of use in the treatment of kidney or gastric diseases related to the function of a sodium/hydrogen ion exchanger. For example, the activity of this gene may be related to over-production of

stomach acid leading to acid reflux disease or peptic ulcer. Results from a second experiment with the probe and primer set Ag2953 are not included. The amp plot indicates that there is a potential problem in one of the sample wells.

**Panel 2D Summary:** Ag1361 Consistent with what was observed in Panel 1.3D, expression of the NOV41a gene in panel 2D is restricted to both normal kidney and stomach adjacent to tumor tissue. Interestingly, expression of the gene is absent in 4/4 gastric tumors and 10/10 kidney cancers when compared to the normal adjacent tissue controls. Thus, the expression of this gene appears to be a consistent trait of the non-neoplastic kidney and stomach. Therefore the absence of expression of this gene could be used as a diagnostic marker for kidney or gastric cancer. In addition, the replacement of this gene, potentially through the direct application of the protein or using gene replacement therapy, could be of use in the treatment of kidney or gastric cancer. Na<sup>+</sup>/H<sup>+</sup> exchangers have previously been implicated in modulation of cellular adhesion and tumor invasion (Refs. 1 and 2).

The association of actin filaments with the plasma membrane maintains cell shape and adhesion. Here, we show that the plasma membrane ion exchanger NHE1 acts as an anchor for actin filaments to control the integrity of the cortical cytoskeleton. This occurs through a previously unrecognized structural link between NHE1 and the actin binding proteins ezrin, radixin, and moesin (ERM). NHE1 and ERM proteins associate directly and colocalize in lamellipodia. Fibroblasts expressing NHE1 with mutations that disrupt ERM binding, but not ion translocation, have impaired organization of focal adhesions and actin stress fibers, and an irregular cell shape. We propose a structural role for NHE1 in regulating the cortical cytoskeleton that is independent of its function as an ion exchanger.

2. Reshkin S.J., Bellizzi A., Albarani V., Guerra L., Tommasino M., Paradiso A., Casavola V. (2000) Phosphoinositide 3-kinase is involved in the tumor-specific activation of human breast cancer cell Na<sup>+</sup>/H<sup>+</sup> exchange, motility, and invasion induced by serum deprivation. *J. Biol. Chem.* 275: 5361-5369.

Whereas the tumor acidic extracellular pH plays a crucial role in the invasive process, the mechanism(s) behind this acidification, especially in low nutrient conditions, are unclear. The regulation of the Na<sup>+</sup>/H<sup>+</sup> exchanger (NHE) and invasion by serum deprivation were

studied in a series of breast epithelial cell lines representing progression from non-tumor to highly metastatic cells. Whereas serum deprivation reduced lactate production in all three cell lines, it inhibited NHE activity in the non-tumor cells and stimulated it in the tumor cells with a larger stimulation in the metastatic cells. The stimulation of NHE in the tumor cell lines was the result of an increased affinity of the internal H(+) regulatory site of the NHE without changes in sodium kinetics or expression. Serum deprivation conferred increased cell motility and invasive ability that were abrogated by specific inhibition of the NHE. Inhibition of phosphoinositide 3-kinase by overexpression of a dominant-negative mutant or wortmannin incubation inhibited NHE activity and invasion in serum replete conditions while potentiating the serum deprivation-dependent activation of the NHE and invasion. These results indicate that the up-regulation of the NHE by a phosphoinositide 3-kinase-dependent mechanism plays an essential role in increased tumor cell invasion induced by serum deprivation.

**Panel 4D Summary:** Ag1361/Ag2953 Two experiments with the same probe and primer sets produce results that are in excellent agreement. The NOV41a transcript is expressed in the thymus in Panel 4D (CT = 28.6), but not in Panel 1.3D (CT = 38). The NOV41A gene encodes a putative ion exchange molecule and may therefore be important in signal transduction in the thymus. Antibodies against the protein encoded for by the NOV41A gene may be used to identify thymic tissue. Additionally, small molecule or antibody therapeutics designed against this putative ion exchanger could disrupt T cell development in the thymus and serve an immunosuppressive function that could be important for tissue transplant.

#### NOV42a and NOV42b

Expression of gene NOV42a and variant NOV42b was assessed using the primer-probe set Ag3002, described in Table AKA. Results of the RTQ-PCR runs are shown in Tables AKB and AKC.

**Panel 1.3D Summary:** Ag3002 Significant expression of the NOV42a gene is limited to the mammary gland and the spleen (CTs=33-34). Thus, expression of this gene could be used to differentiate these samples from other samples on this panel and as a marker for these tissues.

**Panel 4D Summary:** Ag3002 Significant expression of the NOV42a gene is limited to activated B cells, an eosinophil cell line, and monocytes (CTs=33-35). Thus, this transcript could be used as a marker for phagocytic cell types.

#### NOV43

Expression of gene NOV43 was assessed using the primer-probe set Ag2987, described in Table ALA. Results of the RTQ-PCR runs are shown in Tables ALB, ALC, ALD and ALE.

**Table ALA. Probe Name Ag2987**

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2987 The NOV43 gene exhibits significantly higher expression in the brains of Alzheimer's disease patients than normal controls. This is consistent with reports of increased purinoceptor expression in AD. Please see  
5 Panel 1.3D for discussion of utility of this gene in the central nervous system.

Moore D, Iritani S, Chambers J, Emson P. Immunohistochemical localization of the P2Y1 purinergic receptor in Alzheimer's disease. *Neuroreport* 2000 Nov 27;11(17):3799-803

The biological actions of extracellular nucleotides are mediated by two distinct classes  
10 of P2 receptor, P2X and P2Y. The G protein-coupled P2Y receptors comprise five mammalian subtypes, P2Y(1-11). The P2Y1 subtype is expressed abundantly throughout the human brain and is specifically localized to neuronal structures. In the present study, the distribution of the P2Y1 receptor was investigated in Alzheimer's disease (AD) brains. In contrast to control  
15 human brain, the P2Y1 receptor was localized to a number of characteristic AD structures such as neurofibrillary tangles, neuritic plaques and neuropil threads. Immunoblot analysis showed that this specific immunostaining observed over tangles was not a result of cross-reactivity between the anti-P2Y1 antiserum and abnormal tau protein, the major constituent of tangles. The significance of this altered P2Y1 cellular distribution in AD brains is at present unclear.

20 **Panel 1.3D Summary:** Ag2987 The NOV43 gene, a purinoceptor homolog, exhibits highly brain preferential expression in this panel. Purinoceptors found in GDNF sensitive sensory neurons mediate nociceptor function. Therefore, agents that block the action of this receptor may have utility in treating pain, either as analgesics or in inhibiting the establishment

of chronic pain. In addition, adenosine plays a significant neuromodulatory role in brain regions such as the hippocampus, cortex, basal ganglia, and thalamus. Thus, this purinoceptor is localized in a position to participate with the action of adenosine in these brain regions. The NOV43 gene product may also influence  $\text{Ca}^{2+}$  mobilization, a function performed by other purinoceptors.  $\text{Ca}^{2+}$  mobilization is an important component of the molecular process leading to neurotransmitter release, such as dopamine and glutamate. P2Y receptors have been shown to affect the release of dopamine, a critical neurotransmitter deficient in Parkinson's disease. P2 receptor agonists are known to induce secretion. Therefore, agents that modulate NOV43 may be effective treatments for Parkinson's disease via effecting enhanced dopamine release. Furthermore, glutamate is the main excitatory amino acid neurotransmitter. Glutamate exerts excitotoxic neuronal damage and death in a number of pathological conditions, including stroke. Therefore, agents that inhibit this gene product are likely to affect glutamate release in the brain and the subsequent cytotoxic action of glutamate in these regions. The overexpression of this gene in the brains of Alzheimer's disease patients in the CNS\_neurodegeneration\_v1.0 panel indicates that antagonists of this receptor may also have utility in countering the processes associated with this disease.

- Liu DM, Katnik C, Stafford M, Adams DJ. P2Y purinoceptor activation mobilizes intracellular  $\text{Ca}^{2+}$  and induces a membrane current in rat intracardiac neurones. *J Physiol* 2000 Jul 15;526 Pt 2:287-98
1. The mobilization of  $\text{Ca}^{2+}$  by purinoceptor activation and the relative contributions of intra- and extracellular sources of  $\text{Ca}^{2+}$  were investigated using microfluorimetric measurements of fura-2 loaded in cultured neurones from rat intracardiac ganglia.
  2. Reverse transcriptase-polymerase chain reaction (RT-PCR) revealed expression of mRNA for the G protein-coupled P2Y2 and P2Y4 receptors.
  3. Brief application of either 300  $\mu\text{M}$  ATP or 300  $\mu\text{M}$  UTP caused transient increases in  $[\text{Ca}^{2+}]_i$  of  $277 \pm 22$  nM and  $267 \pm 39$  nM, respectively. Removal of external  $\text{Ca}^{2+}$  did not significantly reduce these  $[\text{Ca}^{2+}]_i$  responses.
  4. The order of purinoceptor agonist potency for  $[\text{Ca}^{2+}]_i$  increases was  $\text{ATP} = \text{UTP} > 2\text{-MeSATP} > \text{ADP} \gg \text{adenosine}$ , consistent with the profile for P2Y2 purinoceptors. ATP- and UTP-induced rises in  $[\text{Ca}^{2+}]_i$  were completely and reversibly blocked by 10  $\mu\text{M}$  PPADS (a P2 purinoceptor antagonist) and partially inhibited by 100  $\mu\text{M}$  suramin (a relatively non-specific purinoceptor antagonist).
  5. In the presence of the endoplasmic reticulum  $\text{Ca}^{2+}$ -ATPase inhibitor cyclopiazonic acid (10  $\mu\text{M}$ ) in  $\text{Ca}^{2+}$ -free media, the  $[\text{Ca}^{2+}]_i$  responses evoked by ATP were progressively decreased and abolished.
  6. ATP- and UTP-induced

[Ca<sup>2+</sup>]<sub>i</sub> rises were insensitive to pertussis toxin, caffeine (5 mM) and ryanodine (10 microM) but were significantly reduced by U-73122, a phospholipase C (PLC) inhibitor. 7. In fura-2-loaded cells, perforated patch whole-cell recordings show that ATP and UTP evoked slow outward currents at -60 mV, concomitant with the rise in [Ca<sup>2+</sup>]<sub>i</sub>, in approximately 30 % of rat intracardiac neurones. 8. In conclusion, these results suggest that in r intracardiac neurones, ATP binds to P2Y<sub>2</sub> purinoceptors to transiently raise [Ca<sup>2+</sup>]<sub>i</sub> and activate an outward current. The signalling pathway appears to involve a PTX-insensitive G protein coupled to PLC generation of IP<sub>3</sub> which triggers the release of Ca<sup>2+</sup> from a ryanodine-insensitive Ca<sup>2+</sup> store(s).

10           Driessen B, Bultmann R, Jurna I, Baldauf J. Depression of C fiber-evoked activity by intrathecally administered reactive red 2 in rat thalamic neurons. Brain Res 1998 Jun 15;796(1-2):284-90

          To investigate the possible role of spinal purinoceptors in nociception, the potent P2-purinoceptor antagonist reactive red 2 was studied in rats under urethane anesthesia in which nociceptive activity was elicited by electrical stimulation of afferent C fibers in the sural nerve and recorded from single neurons in the ventrobasal complex of the thalamus. Intrathecal (i.t.) application of reactive red 2 (6-200 micrograms) caused a dose-dependent reduction of the evoked activity in thalamic neurons. The estimated ED<sub>50</sub> was 30 micrograms, and the maximum depression of nociceptive activity amounted to about 70% of the control activity at a dose of 100 micrograms. Morphine, administered i.t. at a maximally effective dose (80 micrograms), inhibited the evoked nociceptive activity by only up to 55% of the control activity. An i.t. co-injection of reactive red 2 (100 micrograms) and morphine (80 micrograms) caused a maximum reduction of the evoked thalamic activity by up to 85% of the control activity, thus, exceeding significantly the effect elicited by either drug alone. Similarly, i.t. co-injection of almost equipotent dosages of reactive red 2 (30 micrograms) and morphine (30 micrograms) caused a maximum reduction of the evoked activity by up to 72% of the control activity, which again exceeded significantly the effect of either drug alone. The results suggest that in rats reactive red 2 exerts antinociception by blockade of P2-purinoceptors in the spinal cord and, hence, support the idea that ATP may play an important role in spinal transmission of nociceptive signals. An activation of the spinal opioid system does not seem to contribute to the effect of reactive red 2 but might act additive or even synergistically with its antinociceptive action.

Krugel U, Kittner H, Franke H, Illes P. Stimulation of P2 receptors in the ventral tegmental area enhances dopaminergic mechanisms in vivo. *Neuropharmacology* 2001 Jun;40(8):1084-93

It has been shown that endogenous adenosine 5'-triphosphate (ATP) as well as its  
5 exogenously applied structural analogue, 2-methylthio ATP (2-MeSATP), facilitate the release  
of dopamine from axon terminals in the rat nucleus accumbens (NAc) by activating ATP-  
sensitive P2 receptors. In the present study, reversed microdialysis of 2-MeSATP (10 microM,  
100 microM and 1 mM), or its microinjection (0.5, 5.0 and 50 pmol) into the ventral tegmental  
area (VTA), dose-dependently increased the local extracellular level of dopamine and the  
10 locomotion in the open field, respectively. These effects were abolished by the P2-receptor  
antagonist pyridoxalphosphate-6-azophenyl-2',4'-disulfonic acid (PPADS). When applied  
alone, the antagonist decreased the basal dopamine concentration, indicating that endogenous  
ATP controls the somatodendritic release of dopamine. Repeated microinjections of 2-  
MeSATP (5 pmol) once daily for 4 days led to a reproducible locomotor stimulation in the  
15 open field. Conditioned locomotion was induced by re-exposure to the novel environment on  
the seventh day. A challenge with amphetamine (1 mg/kg intraperitoneally) on the eighth day  
enhanced the locomotor activity in the 2-MeSATP-treated group in the sense of a cross-  
sensitisation, but failed to do so in the control group. Neurons in the VTA were heavily stained  
with antibodies developed against the P2Y(1) subtype of P2 receptors. Taken together, our  
20 data suggest that P2 receptors (probably of the P2Y(1) subtype) are involved in the initiation  
of somatodendritic dopamine release in the VTA and thereby may have a profound influence  
on sensitisation and reward-motivated behaviour.

Fernandez-Alvarez J, Hillaire-Buys D, Loubatieres-Mariani MM, Gomis R, Petit P. P2  
receptor agonists stimulate insulin release from human pancreatic islets. *Pancreas* 2001  
25 Jan;22(1):69-71

Although P2 receptors for adenosine 5'-triphosphate (ATP) and/or adenosine 5'-  
diphosphate (ADP) have been characterized in mammalian pancreatic beta cells, no evidence  
for an insulin-secreting effect of P2 receptor agonists has been reported as yet in humans. The  
present study aimed at investigating whether P2 receptor agonists could stimulate insulin  
30 release in human pancreatic islets obtained from brain-dead organ donors. Experiments were  
performed using different glucose concentrations and insulin was measured by  
radioimmunoassay. When the glucose concentration (8.3 mmol/L) was slightly stimulating for  
insulin release, alpha,beta-methylene ATP (200 micromol/L) and ADPbetaS (50 micromol/L)  
similarly amplified insulin secretion: both compounds induced a threefold increase in insulin

response. In the presence of a nonstimulating glucose concentration (3.0 mmol/L), only alpha,beta-methylene ATP could induce a significant 1.4-fold increase in insulin release, ADPbetaS being completely ineffective. These results give evidence that P2 receptor agonists are effective in stimulating insulin release in humans, the effect of the P2Y agonist being  
5 essentially glucose dependent

**Panel 4D Summary:** Ag 2987 The NOV43 transcript is expressed in lung fibroblasts after treatment with IFNg, IL-4, IL-9 other cytokines (CTs=32). This gene is also expressed in small airway epithelium treated with the inflammatory cytokines TNF-a and IL-1. This expression profile suggests a role for this transcript in lung inflammation. Low but detectable  
10 expression of this transcript is found also in dermal fibroblasts, primary CD4 T cells, EOL and antigen presenting cells.

This transcript encodes for a PY2receptor like molecule. Expression of this receptor has been reported in several cell types including eosinophils (Ref.1) and lung epithelium where it has been shown to mediate Cl(-) secretion via an increase in intracellular calcium  
15 concentration (ref. 2). Thus, the NOV43 gene product may influence Ca2+ mobilization, a function performed by other purinoceptors, and therefore lead to activation or secretion processes. As suggested by ref.3, the release of nucleotides by damaged cells in inflammation can lead to the activation of purinoreceptors and of other cells present in the inflamed tissues, including lung epithelium in asthma, COPD, emphysema and the skin in psoriasis or  
20 other skin inflammatory diseases. This release can also result in the activation of antigen presenting cells and T cells, which contribute to the perpetuation of the inflammatory process. Therefore, modulation of the expression or activity of the protein encoded by the NOV43 gene may prevent or reduce the inflammation process in all of these diseases and other autoimmune diseases, including as inflammatory bowel diseases.

Functional characterization of P2Y and P2X receptors in human eosinophils. J Cell Physiol 2001 Sep;188(3):329-36

30 Activation of purinoceptor by ATP induces in eosinophils various cell responses including calcium transients, actin polymerization, production of reactive oxygen metabolites, CD11b-expression, and chemotaxis. Here, the effect of ion channel-gated P2X and/or G protein-coupled P2Y receptor agonists ATP, ATPgammaS, alpha,beta-meATP, 2-MeSATP, BzATP, ADP, CTP, and UTP on the intracellular Ca(2+)-mobilization, actin polymerization,

production of reactive oxygen metabolites, CD11b expression and chemotaxis of human eosinophils were measured and the biological activity was analyzed. Although all tested nucleotides were able to induce all these cell responses, the biological activity of the analyzed nucleotides were distinct. Agonists of the G protein-coupled P2Y receptors such as 2-MeSATP, UTP, and ADP have a higher biological activity for production of reactive oxygen metabolites, actin polymerization and chemotaxis in comparison to the ion channel-gated P2X agonists alphabeta-meATP, BzATP, and CTP. In contrast, P2Y and P2X agonist showed similar potencies in respect to intracellular calcium transient and CD11b up-regulation. This conclusion was further supported by experiments with receptor iso-type antagonist KN62, EGTA or with the G(i) protein-inactivating pertussis toxin. These findings indicate participation of different purinoreceptors in the regulation of cell responses in eosinophils.

Laubinger W, Streubel G, Reiser G. Physiological evidence for a P2Y receptor responsive to diadenosine polyphosphates in human lung via Ca(2+) release studies in bronchial epithelial cells. *Biochem Pharmacol* 2001 Mar 1;61(5):623-9

P2Y(2) receptors that are activated by the extracellular nucleotides ATP or UTP mediate Cl(-) secretion via an increase in [Ca(2+)](i) (intracellular calcium concentration). Therefore, in the lung of patients suffering from cystic fibrosis, inhalation of aerosolized UTP offers a way to circumvent the defect in Cl(-) secretion by the cystic fibrosis transmembrane conductance regulator. A possible alternative for the relatively unstable UTP in inhalation therapy is the more resistant diadenosine tetraphosphate (Ap(4)A). In human and rat lung membranes, Ap(4)A binds to P2 receptor sites coupled to G proteins. Here, we showed that Ap(4)A caused an increase in [Ca(2+)](i) with an EC(50) of 17 microM in human bronchial epithelial cells (HBE1). The [Ca(2+)](i) rise evoked by ATP and UTP was completely, but that induced by Ap(4)A only partially, caused by release of Ca(2+) from internal stores. Moreover, the potency of Ap(4)A to mobilize Ca(2+) was lower than that of ATP and UTP (EC(50) 1.5 and 1.8 microM, respectively), and the maximal increase in [Ca(2+)](i) was considerably smaller than that after ATP or UTP. In accordance with our previous results providing evidence for a common binding site for various diadenosine polyphosphates in lung membranes, all Ap(n)A analogues tested (n = 3 to 6) caused a comparable [Ca(2+)](i) increase. Homologous or heterologous prestimulation largely diminished the increase in [Ca(2+)](i) found after a second pulse of either UTP or Ap(4)A. Although specific binding characteristics and functional responses of Ap(4)A on lung cells are in favor of a distinct receptor for Ap(4)A, the cross-talk between UTP and Ap(4)A in HBE1 cells and the only slight differences in Ca(2+) mobilization by ATP or UTP and Ap(4)A render it impossible at

this point to state unequivocally whether there exists a distinct P2Y receptor specific for diadenosine polyphosphates in lung epithelia or whether Ap(4)A activates one of the nucleotide receptors already described.

Di Virgilio F, Chiozzi P, Ferrari D, Falzoni S, Sanz JM, Morelli A, Torboli M,  
5 Bolognesi G, Baricordi OR. Nucleotide receptors: an emerging family of regulatory molecules in blood cells. Blood 2001 Feb 1;97(3):587-600

Nucleotides are emerging as an ubiquitous family of extracellular signaling molecules. It has been known for many years that adenosine diphosphate is a potent platelet aggregating factor, but it is now clear that virtually every circulating cell is responsive to nucleotides.  
10 Effects as different as proliferation or differentiation, chemotaxis, release of cytokines or lysosomal constituents, and generation of reactive oxygen or nitrogen species are elicited upon stimulation of blood cells with extracellular adenosine triphosphate (ATP). These effects are mediated through a specific class of plasma membrane receptors called purinergic P2 receptors that, according to the molecular structure, are further subdivided into 2 subfamilies:  
15 P2Y and P2X. ATP and possibly other nucleotides are released from damaged cells or secreted via nonlytic mechanisms. Thus, during inflammation or vascular damage, nucleotides may provide an important mechanism involved in the activation of leukocytes and platelets. However, the cell physiology of these receptors is still at its dawn, and the precise function of the multiple P2X and P2Y receptor subtypes remains to be understood.

20 **Panel CNS\_1 Summary: Ag2987** The expression in this panel confirms expression of the NOV43 gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

#### NOV44

25 Expression of gene NOV44 was assessed using the primer-probe sets Ag2988 and Ag2989, described in Tables AMA and AMB. Results of the RTQ-PCR runs are shown in Table AMC.

**Table AMA. Probe Name Ag2988**

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |

CNS\_neurodegeneration\_v1.0 Summary: Ag2988/Ag2989 Expression of the NOV44 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 1.3D Summary:** Ag2988/Ag2989 Expression of the NOV44 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2988 Significant expression of this gene is detected in a liver cirrhosis sample (CT = 32.7). This gene encodes a putative GPCR; therefore, antibodies or small molecule therapeutics could reduce or inhibit fibrosis that occurs in liver cirrhosis. In addition, antibodies to this putative GPCR could also be used for the diagnosis of liver cirrhosis.

#### NOV45

Expression of gene NOV45 was assessed using the primer-probe sets Ag2979, Ag2982, Ag2981 and Ag2984, described in Tables ANA, ANB, ANC and AND. Results of the RTQ-PCR runs are shown in Table ANE.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2979/Ag2982 Expression of the NOV45 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 1.3D Summary:** Ag2981/Ag2984 Expression of the NOV45 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2982 Expression of the NOV45 gene is restricted to a few samples, with highest expression in small airway epithelium treated with TNF-alpha and IL-1

- beta (CT=31.2). Significant expression is treated in bronchial epithelium and lung microvascular endothelial cells. Thus, expression of this gene could be used as a marker for activated epithelium. The expression in lung derived samples suggests that this protein may be involved in lung inflammatory disorders, including asthma and chronic obstructive pulmonary disorder. Results from a second experiment with the probe/primer set Ag2979 are not included because the amp plot indicates that there is a potential problem in one of the sample wells.

### NOV46a and NOV46b

- Expression of gene NOV46s and variant NOV46b was assessed using the primer-probe sets Ag2990 and Ag2991, described in Tables AOA and AOB. Results of the RTQ-PCR runs are shown in Tables AOC. Please note that variant NOV46B does not match the probe and primer set Ag2990.

**Table AOA. Probe Name Ag2990**

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2990/Ag2991 Expression of the NOV46a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 1.3D Summary:** Ag2990/Ag2991 Expression of the NOV46a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 4D Summary:** Ag2990/Ag2991 Expression of the NOV46a gene is restricted to liver cirrhosis and TNFalpha + IL1beta treated bronchial and small airway epithelium. This expression profile suggests that antibodies or small molecule therapeutics designed with the putative protein encoded by this gene could reduce or inhibit fibrosis that occurs in liver cirrhosis. In addition, antibodies to this putative protein product could also be used for the diagnosis of liver cirrhosis. In addition, the expression of this gene in tissues derived from the lung suggests that this gene product may be involved in pathological and inflammatory lung disorders that include chronic obstructive pulmonary disease, asthma, allergy and emphysema. A second experiment with Ag290 shows low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

#### NOV46d

Expression of gene NOV46d was assessed using the primer-probe sets Ag2992 and Ag513, described in Tables APA and APB. Results of the RTQ-PCR runs are shown in Tables APC and APD.

**Table APA. Probe Name Ag2992**

| Primers | Sequences                                 | Length | Start Position | SEQ ID NO: |
|---------|-------------------------------------------|--------|----------------|------------|

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2992 Expression of the NOV46d gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

**Panel 1.1 Summary:** Ag513 Expression of the NOV46d gene is limited to two samples derived from lung cancer and ovarian cancer cell lines (CTs=31-32). Thus, expression of this gene could be used to differentiate between these sample and other samples on this panel and as a marker to detect the presence of lung and ovarian cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of lung and ovarian cancers.

**Panel 1.2 Summary:** Ag513 Expression of the NOV46d gene is restricted to samples derived from lung cancer, ovarian cancer, and colon cancer cell lines (CTs=31-32). This expression profile is in agreement with the expression seen in Panel 1.1. Thus, expression of this gene could be used to differentiate between these sample and other samples on this panel and as a marker to detect the presence of these cancers. Furthermore, therapeutic modulation

of the expression or function of this gene may be effective in the treatment of lung, ovarian, and colon cancers.

**Panel 1.3D Summary:** Ag2992 Expression of the NOV46d gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

5 **Panel 4D Summary:** Ag2992 Expression of the NOV46d gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

#### NOV46c

Expression of gene NOV46c was assessed using the primer-probe set Ag2985, described in Table AQA.

10

**Table AQA. Probe Name Ag2985**

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |
|---------|------------------------------------------------|--------|----------------|------------|
| Forward | 5'-tctgtcatcccatctccaaa-3'                     | 20     | 285            | 1183       |
| Probe   | TET-5'-atcctcattcctgtgatgacctttct-3'-<br>TAMRA | 26     | 305            | 1184       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2985 Expression of the NOV46c gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

15 **Panel 4D Summary:** Ag2985 Expression of the NOV46c gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

#### NOV47

Expression of gene NOV47 was assessed using the primer-probe set Ag2993, described in Table ARA. Results of the RTQ-PCR runs are shown in Tables ARB, ARC and ARD.

20

**Table ARA. Probe Name Ag2993**

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2993 This panel does not show differential expression of the NOV47 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag2993 Significant expression of the NOV47 gene is restricted to the brain, with expression in the thalamus (CT=34.4). This gene also shows strong expression in the brain in the previous panel suggesting that this gene product may be involved in the normal functioning of the brain. Thus, the protein encoded by this gene may represent a small molecule target for the treatment of neurologic diseases.

**Panel 4D Summary:** Ag2993 The NOV47 gene, a Peptidyl Prolyl Cis-Trans Isomerase A homolog, is a novel member of the family of receptors for the widely used immunosuppressants cyclosporin A and FK506 (see Wang et al., 2001). The NOV47 gene is expressed at moderate levels in many of the tissues in this panel and is expressed at a somewhat higher level (CT = 30.3) in ionomycin-stimulated Ramos B lymphocytes. Therefore, small molecule drugs that antagonize the activity of the NOV47 gene product may be useful as immunosuppressants to reduce or eliminate the symptoms in patients with

autoimmune or inflammatory conditions, such as Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

- Peptidyl-prolyl isomerases (PPIases) are ubiquitous cellular enzymes that play roles in cellular signaling and protein folding. In addition, these proteins are the receptors for the widely used immunosuppressants cyclosporin A and FK506. We report the first structure-
- 10 activity studies of de novo designed inhibitors of cyclophilin, the cellular target of cyclosporin A. Our mechanism-based inhibitors were modeled on the ground- and transition-state structures of proline-containing peptides, the natural substrates of the enzyme. Both ground-state analogues 1 and transition-state analogues 2 were prepared as single enantiomers from L-proline following a "self-reproduction of chirality" procedure. The binding affinities of the
- 15 analogues for the active site of cyclophilin were measured by a fluorescence perturbation assay. While the transition-state analogues 2 did not display significant avidity for the active site ( $K(d) = 77$  microM for 2b), several ground-state analogues bound to the enzyme with low micromolar affinity ( $K(d) = 1.5$  microM for 1e). These results proclaim that properly designed small molecular weight molecules can form strong complexes with cyclophilin and may find
- 20 use as probes in cell biology and as therapeutic agents.

#### NOV48a

Expression of gene NOV48a was assessed using the primer-probe set Ag3006, described in Table ASA. Results of the RTQ-PCR runs are shown in Tables ASB, ASC, ASD, ASE and ASF.

**AI\_comprehensive panel\_v1.0 Summary:** Ag3006 The NOV48a gene is a novel member of the Phospholipase C family that is expressed at moderate to low levels in numerous cell types involved in the immune response in health and disease. In addition, the NOV48a gene is expressed at higher levels (CTs range 29-32) in samples obtained from patients with several autoimmune and inflammatory diseases, particularly a subset of samples from osteoarthritic synovium and psoriasis. Therefore, small molecule drugs that antagonize the activity of this gene product may be useful as immunosuppressants to reduce or eliminate the symptoms in patients with conditions, such as osteoarthritis, psoriasis, Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, or lupus erythematosus.

**Panel 1.3D Summary:** Ag3006 Highest expression of the NOV48a gene, a phospholipase C homolog, is seen in skeletal muscle (CT=27.6). Phosphatidylinositol-specific phospholipase C (PLC) plays an important role in receptor-mediated signal transduction. In addition to skeletal muscle, this gene is expressed in heart, liver, adipose, adrenal, thyroid, and pancreas. This widespread expression in metabolic tissues suggests that this gene product may be involved in cellular regulation of metabolism through interactions with the insulin receptor.

A therapeutic modulator to this gene and/or gene-product may be useful in the treatment of metabolic diseases that affect skeletal muscle metabolism. This gene and/or gene-product may also prove useful in differentiating between fetal and adult forms of skeletal muscle tissue, since it is expressed at much higher levels in the adult (CT=27) when compared to expression  
5 in the fetal tissue (CT=32).

This gene is also expressed at a low level in almost all cancer cell lines in this panel. Hence, it is probably required for cell survival and proliferation and therefore, inhibition of this gene in cancer can probably be used as therapy.

In addition, increased expression of PLC delta has been observed in the brains of  
10 Alzheimer's disease patients, indicating a role for this class of enzyme in the disease process. Therefore, inhibitors of the NOV48A protein product, by countering this disease associated process, may have utility in treating Alzheimer's disease and other neurodegenerative disorders.

15 Tanino H, Shimohama S, Sasaki Y, Sumida Y, Fujimoto S. Increase in phospholipase C-delta1 protein levels in aluminum-treated rat brains. *Biochem Biophys Res Commun* 2000 May 19;271(3):620-5

The effect of administration of aluminum to rats on the level of three phospholipase C (PLC) isozymes (beta1, gamma1, and delta1) was assessed in a variety of brain tissues. After  
20 exposure to aluminum, a statistically significant increase in malondialdehyde, an index of lipid peroxidation, was observed. In addition, there was a significant reduction in the catalytic activity of low molecular weight phosphotyrosine phosphatase, which loses its activity during oxidative stress. This suggests that oxidative stress is induced in brain tissues exposed to aluminum. The protein level of PLC-delta1, but not that of PLC-beta1 or -gamma1, was  
25 significantly increased in brains where oxidative stress had been induced. The total PLC activity in aluminum-treated rat brains was significantly higher than that in control brains. These results suggest that PLC-delta1 protein levels in brain tissues are increased by the induction of oxidative stress, giving an explanation for its up-regulation in Alzheimer's disease.

30 **Panel 2D Summary:** Ag3006 The NOV48A gene is expressed at a low to moderate level in most of the tissues on this panel. There is increased expression in ovarian and breast cancer compared to normal adjacent tissue. Thus, expression of this gene could potentially be used as a diagnostic marker for the presence of cancer. Furthermore, inhibition of this gene in ovarian and breast cancer may be useful as a therapeutic treatment. Additionally, there is

increased expression in normal kidney samples compared to adjacent tumors. Thus, decreased expression of this gene could be used as a diagnostic marker for kidney cancer and therapeutic modulation of expression of this gene in tumors may be used to treat these cancers.

**Panel 3D Summary:** Ag3006 The NOV48a gene is expressed at a low level in almost all cancer cell lines in this panel with the highest expression in DMS-79 (CT=29.21). This ubiquitous pattern of expression suggests that this gene product may be required for cell survival and proliferation and inhibition of this gene in cancer may therefore be useful as a therapy.

**Panel 4D Summary:** Ag3006 The NOV48a gene is ubiquitously expressed among the samples on this panel, suggesting a role for this protein product in inflammation. Please see AI\_comprehensive panel\_v1.0 for further discussion of utility of this gene in inflammation. Results from a second experiment with the CG56003-01 gene are not included. The amp plot indicates that there were experimental difficulties with this run.

#### NOV49

Expression of gene NOV49 was assessed using the primer-probe set Ag3003, described in Table ATA. Results of the RTQ-PCR runs are shown in Table ATB.

**Table ATA. Probe Name Ag3003**

| Primers | Sequences                                   | Length | Start Position | SEQ ID NO: |
|---------|---------------------------------------------|--------|----------------|------------|
| Forward | 5'-catctcgtccaccctacgtt-3'                  | 20     | 299            | 1192       |
| Probe   | TET-5'-cttcagctgctgttgcaactcaaggat-3'-TAMRA | 26     | 339            | 1193       |
| Reverse | 5'-ttcaggaagccatagaaactca-3'                | 22     | 366            | 1194       |

**Panel 1.3D Summary:** Ag3003 Expression of the NOV49 gene is restricted to a sample derived from a breast cancer cell line (CT=34.7). Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of breast cancer. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of breast cancer.

**Panel 4D Summary:** Ag3003 Expression of the NOV49 gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.)

#### NOV50a

Expression of gene NOV50a was assessed using the primer-probe set Ag3014,  
described in Table AUA.

**Table AUA. Probe Name Ag3014**

| Primers | Sequences                                      | Length | Start<br>Position | SEQ ID NO: |
|---------|------------------------------------------------|--------|-------------------|------------|
| Forward | 5'-gactgagcggttgcccttttct-3'                   | 20     | 1065              | 1195       |
| Probe   | TET-5'-agctacctcccaaagcagcctgacct-3'-<br>TAMRA | 26     | 1088              | 1196       |
| Reverse | 5'-acaatccctgcacaacgat-3'                      | 19     | 1138              | 1197       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3014 Expression of the NOV50a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

**Panel 1.3D Summary:** Ag3014 Expression of the NOV50a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

**Panel 4D Summary:** Ag3014 Expression of the NOV50a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown.) The amp plot indicates that there is a high probability of a probe failure.

## 10 NOV53

Expression of gene NOV53 was assessed using the primer-probe set Ag3008, described in Table AVA. Results of the RTQ-PCR runs are shown in Tables AVB, AVC and AVD.

**Table AVA. Probe Name Ag3008**

15

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3008 This panel does not show differential expression of the NOV53 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3008 Highest expression of the NOV53 gene is seen in a brain cancer cell line (CT=29). In addition, this gene has low to moderate expression in all the cancer cell lines used in this panel. Thus, expression of this gene might be used as a diagnostic marker in brain, colon, renal, lung, melanoma and ovarian cancers.

This gene encodes a homolog of uracil phosphoribosyltransferase. This gene has low to moderate expression in several endocrine/metabolically-related tissues, including; adipose, adrenal, pancreas, liver and skeletal muscle. Therefore, a therapeutic modulator to this gene and/or gene-product may prove useful in the treatment of diseases which affect the endocrine system.

In addition, this gene shows moderate to low levels in the CNS and may be a small molecule target for the treatment of neurologic diseases.

**Panel 4D Summary:** Ag3008 The NOV53 gene, a uracil phosphoribosyl-transferase homolog is expressed at moderate to low levels in numerous cell types involved in the immune response. Higher levels of expression are seen in activated B lymphocytes, represented by ionomycin-activated Ramos (CT=27.6), and pokeweed mitogen-activated B lymphocytes (CT=28.02). Therefore, small molecules that antagonize the function of this gene product may be useful as therapeutic drugs to reduce or eliminate the symptoms in patients with autoimmune and inflammatory diseases in which B cells play a part in the initiation or progression of the disease process, such as lupus erythematosus, Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, or psoriasis.

**NOV54a**

Expression of gene NOV54a was assessed using the primer-probe sets Ag3015 and Ag3070, described in Tables AWA and AWB. Results of the RTQ-PCR runs are shown in Tables AWC, AWD, AWE and AWF.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3015/Ag2070 This panel does not show differential expression of the NOV54a gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3015/Ag2070 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression in fetal heart (CTs=29-30). This expression is higher than the expression seen in adult heart (CTs=32-33). Thus, expression of this gene could be used to differentiate between the two sources of this tissue. This gene is expressed in other metabolic tissues including adipose, adrenal, liver, pancreas, skeletal muscle and thyroid. This gene encodes a homolog of protein phosphatase 2C (PP2C), which has been linked to the regulation of hormone-sensitive lipase, the rate-limiting enzyme in adipose tissue lipolysis (Eur J Biochem 1987 Oct 15;168(2):399-405). PP2C may also play a role in controlling insulin signaling. Therefore, a therapeutic modulator of this gene and/or gene-product may prove useful in the treatment of diseases affecting the endocrine system.

In addition, protein phosphatase 2C plays a role in dopamine and serotonin signaling. Specifically, PP2C counters the action of these neurotransmitters on DARPP-32. These neurotransmitter systems are the primary targets of drugs that treat schizophrenia and depression. Therefore, agents that inhibit this gene product may have utility in treating these disorders.

#### References:

Desdouits F, Siciliano JC, Naim AC, Greengard P, Girault JA. Dephosphorylation of Ser-137 in DARPP-32 by protein phosphatases 2A and 2C: different roles in vitro and in striatonigral neurons. Biochem J 1998 Feb 15;330 ( Pt 1):211-6

DARPP-32 (dopamine- and cAMP-regulated phosphoprotein, Mr=32000) is highly expressed in striatonigral neurons in which its phosphorylation is regulated by several neurotransmitters including dopamine and glutamate. DARPP-32 becomes a potent inhibitor of protein phosphatase 1 when it is phosphorylated on Thr-34 by cAMP- or cGMP-dependent protein kinases. DARPP-32 is also phosphorylated on Ser-137 by protein kinase CK1 (CK1), in vitro and in vivo. This phosphorylation has an important regulatory role since it inhibits the dephosphorylation of Thr-34 by calcineurin in vitro and in striatonigral neurons. Here, we show that DARPP-32 phosphorylated by CK1 is a substrate in vitro for protein phosphatases 2A and 2C, but not protein phosphatase 1 or calcineurin. However, in substantia nigra slices, dephosphorylation of Ser-137 was markedly sensitive to decreased temperature, and not detectably affected by the presence of okadaic acid under conditions in which dephosphorylation of Thr-34 by protein phosphatase 2A was inhibited. These results suggest that, in neurons, phospho-Ser-137-DARPP-32 is dephosphorylated by protein phosphatase 2C, but not 2A. Thus, DARPP-32 appears to be a component of a regulatory cascade of

phosphatases in which dephosphorylation of Ser-136 by protein phosphatase 2C facilitates dephosphorylation of Thr-34 by calcineurin, removing the cyclic nucleotide-induced inhibition of protein phosphatase 1.

Overall, expression of this gene is appears to be associated with normal tissues over  
5 cancer cell lines. Thus, expression of this gene could be used to differentiate between normal and malignant tissues and potentially as a treatment for cancer.

**Panel 2.2 Summary:** Ag3070 As seen in the previous panel, the NOV54a gene shows greater expression in normal tissues than in samples derived from malignant tissue. Thus, expression of this gene may be useful in distinguishing the two types of tissue.

10 **Panel 4D Summary:** Ag3015/Ag2070 Two experiments with the same probe and primer set produce results that are in excellent agreement. The NOV54a gene, a protein phosphatase 2C homolog is expressed by T lymphocytes prepared under a number of conditions at moderate levels and is expressed at higher levels in treated and untreated dendritic cells, monocytes, and macrophages. Dendritic cells and macrophages are powerful  
15 antigen-presenting cells (APC) whose function is pivotal in the initiation and maintenance of normal immune responses. Autoimmunity and inflammation may also be reduced by suppression of this function. Therefore, small molecule drugs that antagonize the function of this gene product may reduce or eliminate the symptoms in patients with several types of autoimmune and inflammatory diseases, such as lupus erythematosus, Crohn's disease,  
20 ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, or psoriasis.

## NOV55

Expression of gene NOV55 was assessed using the primer-probe set Ag3024,  
described in Table AXA. Results of the RTQ-PCR runs are shown in Tables AXB, AXC,  
25 AXD, AXE, AXF, AXG and AXH.

**AI\_comprehensive\_panel\_v1.0 Summary:** Ag3024 The NOV55 gene is found at low but significant levels in lung tissue from COPD, emphysema and asthma patients. This expression is consistent with panel 4D which shows expression in small airway epithelium. Therefore, this gene could be a marker or a target for lung inflammatory diseases.

5       **CNS\_neurodegeneration\_v1.0 Summary:** Ag3024 Results of two experiments with the same probe and primer set confirm expression of the NOV55 gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

10       **Panel 1.3D Summary:** Ag3024 Expression of the NOV55 gene, a heparin sulfate proteoglycan homolog, is highly brain preferential and suggests a role for this gene product in CNS processes. Heparin sulfate proteoglycans (HSPGs) are a component of amyloid plaques in Alzheimer's disease. The interaction of apoE with HSPGs has also been implicated in the pathogenesis of Alzheimer's disease and may play a role in neuronal repair. apoE has an HSPG-binding site highly complementary to heparan sulfates rich in N- and O-sulfo groups. Therefore, enzymes that influence the structure of HSPGs, such as the putative protein product  
15 of the NOV55 gene, may influence protein aggregation and the functional processes underlying Alzheimer's disease. Thus, agents that target and modulate the activity of this gene product may be effective in the treatment of neurodegenerative diseases including Alzheimer's disease. This gene is also expressed in breast and brain cancer cell lines at low but significant levels. Therefore, the expression of this gene could be of use as a marker for breast and brain cancer.  
20 In addition, therapeutic inhibition of the activity of the product of this gene, through the use of antibodies or small molecule drugs, may be useful in the therapy of brain and breast cancer.

**References:**

Libeu CP, Lund-Katz S, Phillips MC, Wehrli S, Hernaiz MJ, Capila I, Linhardt RJ, Raffai RL, Newhouse YM, Zhou F, Weisgraber KH. New insights into the heparan sulfate proteoglycan-binding activity of apolipoprotein E. J Biol Chem 2001 Oct 19;276(42):39138-  
25 44

Defective binding of apolipoprotein E (apoE) to heparan sulfate proteoglycans (HSPGs) is associated with increased risk of atherosclerosis due to inefficient clearance of lipoprotein remnants by the liver. The interaction of apoE with HSPGs has also been  
30 implicated in the pathogenesis of Alzheimer's disease and may play a role in neuronal repair. To identify which residues in the heparin-binding site of apoE and which structural elements of heparan sulfate interact, we used a variety of approaches, including glycosaminoglycan specificity assays, <sup>13</sup>C nuclear magnetic resonance, and heparin affinity chromatography. The formation of the high affinity complex required Arg-142, Lys-143, Arg-145, Lys-146, and

Arg-147 from apoE and N- and 6-O-sulfo groups of the glucosamine units from the heparin fragment. As shown by molecular modeling, using a high affinity binding octasaccharide fragment of heparin, these findings are consistent with a binding mode in which five  
5 saccharide residues of fully sulfated heparan sulfate lie in a shallow groove of the alpha-helix that contains the HSPG-binding site (helix 4 of the four-helix bundle of the 22-kDa fragment). This groove is lined with residues Arg-136, Ser-139, His-140, Arg-142, Lys-143, Arg-145, Lys-146, and Arg-147. In the model, all of these residues make direct contact with either the 2-O-sulfo groups of the iduronic acid monosaccharides or the N- and 6-O-sulfo groups of the glucosamine sulfate monosaccharides. This model indicates that apoE has an HSPG-binding  
10 site highly complementary to heparan sulfate rich in N- and O-sulfo groups such as that found in the liver and the brain.

Inoue S. Basement membrane and beta amyloid fibrillogenesis in Alzheimer's disease. Int Rev Cytol 2001;210:121-61

High-resolution ultrastructural and immunohistochemical studies revealed that in situ  
15 beta amyloid fibrils of Alzheimer's disease were made up of a core consisting of a solid column of amyloid P component (AP) and associated chondroitin sulfate proteoglycan, and a heparan sulfate proteoglycan surface layer with externally associated fine filaments of beta protein. The main body of beta amyloid fibrils closely resembled that of microfibrils. Abundant microfibrils were reported to be present at the basement membrane of capillaries  
20 with "leaky" blood-urine or blood-air barriers. Similarly, abundant microfibril-like beta amyloid fibrils are formed at the microvascular basement membrane in cerebrovascular amyloid angiopathy with altered blood-brain barrier. Since AP is an indispensable major component of microfibrils and microfibril-like structures, the formation of microfibrils may depend on, among other factors, the availability of AP. Thus, in beta amyloid fibrillogenesis  
25 fibrils may be built around AP which continuously leaks out from circulation into vascular basement membrane, and beta amyloid fibrils may be regarded as pathologically altered basement membrane-associated microfibrils. With no source of AP around them, senile plaque fibrils may also be derived from perivascular amyloid.

**Panel 2D Summary:** Ag3024 The NOV55 gene is expressed at low but significant  
30 levels in most of the samples on this panel, with highest expression in a kidney cancer sample (CT=30.6). Significant levels of expression are also seen in samples derived from breast and gastric cancer samples.

Therefore, expression of this gene could be of use as a marker for breast and gastric cancer. In addition, therapeutic inhibition of the activity of the product of this gene, through

the use of antibodies or small molecule drugs, may be useful in the therapy of breast and gastric cancer.

**Panel 3D Summary:** Ag3024 The NOV55 gene is expressed at low but significant levels in cell lines from a renal carcinoma, colon cancer, glioblastoma and three lung cancer lines. Thus, this gene could be a marker as well as a target for inhibition in these cancers.

**Panel 4D Summary:** Ag3024 The NOV55 gene, a heparin Sulfate 6-Sulfotransferase 3 homolog, is expressed at low but significant levels in thymus and small airway epithelium treated with TNFalpha + IL-1beta (CTs=34). Thus, the NOV55 gene product may be a marker for thymus or activated small airway epithelium.

**Panel CNS\_1 Summary:** Ag3024 Expression of the NOV55 gene in this panel confirms the presence of this gene product in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

#### NOV56a and NOV56b

Expression of gene NOV56a and variant NOV56b was assessed using the primer-probe sets Ag3027 and Ag1169, described in Tables AYA and AYB. Results of the RTQ-PCR runs are shown in Tables AYC, AYD, AYE, AYF, AYG, AYH and AYI.

**Table AYA. Probe Name Ag3027**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|
| Forward | 5'-aaaaccagatttggagttcggtt-3'              | 22     | 355            | 1210       |
| Probe   | TET-5'-cttgaaatgtcctcaccacaactgat-3'-TAMRA | 26     | 377            | 1211       |

**General\_screening\_panel\_v1.5 Summary:** Ag3027 Expression of the NOV56a gene is highest in a sample derived from a lung cancer (CT=30.5). Significant expression is also

seen in samples derived from colon cancer and ovarian cancer. Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of lung, colon, and breast cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of lung, colon and breast cancers.

While expression of this gene is seen predominantly in cancer cell lines, significant expression is also seen in fetal kidney (CT=31.8). Furthermore, expression is higher in fetal kidney than in adult kidney (CT=35.8). Thus, expression of this gene could be used to differentiate between adult and fetal kidney. In addition, the expression in fetal kidney suggests that this gene product may be involved in the development of the kidney. Therefore, therapeutic modulation of the expression or function of this gene may be useful in treating disease of the kidney.

**Panel 1.2 Summary:** Ag1169 Results from one experiment, Run 129128191, with the NOV56a gene are in agreement with Results in Panel 1.3D and General\_screening\_panel\_v1.5. A second run, Run 129656838, produces disparate results.

**Panel 1.3D Summary:** Ag1169/Ag3027 Two experiments with the same probe and primer both show highest expression of the gene NOV56a in the mammary gland (CTs=31). Low, but significant levels of expression are also seen in a lung cancer cell line. Thus, expression of this gene may be used to differentiate between these samples and other samples on this panel.

**Panel 2D Summary:** Ag3027 Highest expression of the NOV56a gene is seen in a gastric cancer. Significant expression is also seen in breast cancer, colon cancer and normal kidney. Thus, expression of this gene could be used to differentiate between these samples and other samples on this panel and as a marker for the presence of breast, colon and kidney cancers. A second experiment with the probe/primer set Ag1169 is not included. The amp plot indicates that there were experimental difficulties with this run.

**Panel 3D Summary:** Ag1169 Expression of the NOV56a gene is restricted to samples derived from lung and gastric cancer cell lines (CTs=33-35). Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of lung and gastric cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of lung and gastric cancers.

**Panel 4D Summary:** Ag1169/Ag3027 Two experiments with the same probe and primer set show expression of the NOV56a gene limited to the thymus (CTs=32-33). Thus,

expression of this gene could be used as a marker for thymic tissue. Furthermore, this restricted expression suggests that this gene product may play an important role in T cell development. Therefore, small molecule therapeutics, or antibody therapeutics designed against the protein encoded for by this gene could be utilized to modulate immune function (T cell development) and be important for organ transplant, AIDS treatment or post chemotherapy immune reconstitution.

**Panel 5 Islet Summary:** Ag3027 Expression of the NOV56a gene is restricted to a sample derived from the kidney (CT=34.9). This expression is consistent with expression in Panel 1.3D. Thus, expression of this gene could be used as a marker for kidney tissue.

## 10 NOV57

Expression of gene NOV57 was assessed using the primer-probe sets Ag3031, Ag1301b and Ag1415, described in Tables AZA, AZB and AZC. Results of the RTQ-PCR runs are shown in Tables AZD, AZE, AZF and AZG.

**Table AZA. Probe Name Ag3031**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|
| Forward | 5'-aaaaggtgatgtctggagcat-3'                | 21     | 616            | 1216       |
| Probe   | TET-5'-tgtatgtcatgctctgtgccagccta-3'-TAMRA | 26     | 648            | 1217       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3031 Two experiments with the same probe and primer set produce results that are in excellent agreement. The NOV57 gene, a kinase homolog, is expressed more highly in the temporal cortex of brains from Alzheimer's disease patients than in the temporal cortex of normal brains unaffected by Alzheimer's disease. Kinases have been shown to play a role in the pathogenesis of Alzheimer's disease. The dysregulation of this kinase, NOV57, indicates an active role for this pathway in disease pathogenesis. Thus, inhibitors of this gene product, by modulating this pathway, may have utility in the treatment of Alzheimer's disease and other neurodegenerative diseases.

Morishima Y, Gotoh Y, Zieg J, Barrett T, Takano H, Flavell R, Davis RJ, Shirasaki Y, Greenberg ME. Beta-amyloid induces neuronal apoptosis via a mechanism that involves the c-Jun N-terminal kinase pathway and the induction of Fas ligand. J Neurosci 2001 Oct 1;21(19):7551-60

Elevated levels of beta-Amyloid (Abeta) are present in the brains of individuals with either the sporadic or familial form of Alzheimer's disease (AD), and the deposition of Abeta within the senile plaques that are a hallmark of AD is thought to be a primary cause of the

cognitive dysfunction that occurs in AD. Recent evidence suggests that Abeta induces neuronal apoptosis in the brain and in primary neuronal cultures, and that this Abeta-induced neuronal death may be responsible in part for the cognitive decline found in AD patients. In this study we have characterized one mechanism by which Abeta induces neuronal death. We found that in cortical neurons exposed to Abeta, activated c-Jun N-terminal kinase (JNK) is required for the phosphorylation and activation of the c-Jun transcription factor, which in turn stimulates the transcription of several key target genes, including the death inducer Fas ligand. The binding of Fas ligand to its receptor Fas then induces a cascade of events that lead to caspase activation and ultimately cell death. By analyzing the effects of mutations in each of the components of the JNK-c-Jun-Fas ligand-Fas pathway, we demonstrate that this pathway plays a critical role in mediating Abeta-induced death of cultured neurons. These findings raise the possibility that the JNK pathway may also contribute to Abeta-dependent death in AD patients

**Panel 1.3D Summary:** Ag1301b/Ag3031 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the NOV57 gene in a brain cancer cell line (CTs=29-30). Overall, this gene is expressed at moderate to low levels in all the samples in this panel.

This gene has low to moderate expression in several endocrine/metabolic-related tissues, including adipose, pancreas, liver, skeletal muscle and thyroid. Thus, a therapeutic modulator to this gene and/or gene-product may be useful in the treatment of diseases which affect the endocrine system.

**Panel 2.2 Summary:** Ag1301b The NOV57 gene is expressed in breast cancer at a moderate level. It is also expressed at a higher level in normal gastric, prostate and colon tissues compared to the adjacent tumors. Hence, inhibition of this drug might be used for treatment of breast cancer. It could also be used as a diagnostic marker for gastric, prostate and colon cancers.

**Panel 4D Summary:** Ag1301b/Ag1415/Ag3031 Three experiments with the same probe and primer sets produce results that are in excellent agreement, with highest expression of the NOV57 gene in the thymus and kidney. This gene is also expressed at higher levels in resting Th1 and Th2 lymphocytes than in activated Th1 and Th2 lymphocytes. Therefore, small molecule agonists of the gene product may be useful as therapeutics to reduce the activation of Th1 and Th2 cells and thus reduce symptoms in patients with autoimmune and inflammatory diseases, such as Crohn's disease, ulcerative colitis, multiple sclerosis, chronic

obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

#### NOV58a and NOV58b: Gap Junction Beta-5 (connexin)

Expression of gene NOV58a and variant NOV58b was assessed using the primer-probe set Ag2914, described in Table BAA.

**Table BAA. Probe Name Ag2914**

| Primers | Sequences                                   | Length | Start Position | SEQ ID NO: |
|---------|---------------------------------------------|--------|----------------|------------|
| Forward | 5'-aacactgtggactgcttcatct-3'                | 22     | 517            | 1225       |
| Probe   | TET-5'-ccaaacccactgagaagacgatcttca-3'-TAMRA | 27     | 539            | 1226       |
| Reverse | 5'-atacacaagcatgaggtgatga-3'                | 22     | 578            | 1227       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2914 The amp plot indicates that there are experimental difficulties with this run (data not shown).

**Panel 1.3D Summary:** Ag2914 Expression of this gene is low/undetectable (CTs >35) across all of the samples on this panel (data not shown).

**Panel 2D Summary:** Ag2914 Expression of this gene is low/undetectable (CTs >35) across all of the samples on this panel (data not shown).

**Panel 4D Summary:** Ag2914 The amp plot indicates that there are experimental difficulties with this run (data not shown).

#### BB. CG56633-01: TRANSLATION INITIATION FACTOR 5

Expression of gene CG56633-01 was assessed using the primer-probe set Ag2900, described in Table BBA. Results of the RTQ-PCR runs are shown in Tables BBB, BBC, BBD and BBE.

**Table BBA. Probe Name Ag2900**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|
| Forward | 5'-gctaagttccttgatgcttctg-3'               | 22     | 184            | 1228       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2900 This panel confirms the expression of this gene at low levels in the brain in an independent group of individuals. However, no differential expression of this gene was detected between Alzheimer's diseased postmortem brains and those of non-demented controls in this experiment. Please see Panel 1.3D for a discussion of the potential utility of this gene in treatment of central nervous system disorders.

**Panel 1.3D Summary:** Ag2900 The CG56633-01 gene is expressed at moderate levels in the cancer cell lines in this panel, with highest expression in a breast cancer cell line (CT=27). Expression of this gene could potentially be used as a diagnostic marker of cell proliferation and hence as a diagnostic marker for cancer.

This gene also has moderate levels of expression in adipose, liver, heart, skeletal muscle, adrenal, pituitary, thyroid and pancreas. Therefore, therapeutic modulation of this

gene product may be a treatment for endocrine and metabolic diseases, including obesity and Types 1 and 2 diabetes.

Overall, this gene, a translation initiation factor homolog, exhibits brain-preferential expression, particularly in the hippocampus, a structure critical for learning and memory. The processes of learning and memory are subject to regulation by mechanisms of translational and transcriptional control, including the regulation elongation factor phosphorylation by the memory-mediating NMDA receptor. The hippocampus-preferential expression of this gene suggests that it plays a role in translationally-mediated learning and memory processes. Therefore, agents that modulate the activity and function of this gene product may have utility in treating CNS disorders involving memory deficits, including Alzheimer's disease and aging.

Scheetz AJ, Nairn AC, Constantine-Paton M. N-methyl-D-aspartate receptor activation and visual activity induce elongation factor-2 phosphorylation in amphibian tecta: a role for N-methyl-D-aspartate receptors in controlling protein synthesis. *Proc Natl Acad Sci U S A* 1997 Dec 23;94(26):14770-5

N-methyl-D-aspartate receptor (NMDAR) activation has been implicated in forms of synaptic plasticity involving long-term changes in neuronal structure, function, or protein expression. Transcriptional alterations have been correlated with NMDAR-mediated synaptic plasticity, but the problem of rapidly targeting new proteins to particular synapses is unsolved. One potential solution is synapse-specific protein translation, which is suggested by dendritic localization of numerous transcripts and subsynaptic polyribosomes. We report here a mechanism by which NMDAR activation at synapses may control this protein synthetic machinery. In intact tadpole tecta, NMDAR activation leads to phosphorylation of a subset of proteins, one of which we now identify as the eukaryotic translation elongation factor 2 (eEF2). Phosphorylation of eEF2 halts protein synthesis and may prepare cells to translate a new set of mRNAs. We show that NMDAR activation-induced eEF2 phosphorylation is widespread in tadpole tecta. In contrast, in adult tecta, where synaptic plasticity is reduced, this phosphorylation is restricted to short dendritic regions that process binocular information. Biochemical and anatomical evidence shows that this NMDAR activation-induced eEF2 phosphorylation is localized to subsynaptic sites. Moreover, eEF2 phosphorylation is induced by visual stimulation, and NMDAR blockade before stimulation eliminates this effect. Thus, NMDAR activation, which is known to mediate synaptic changes in the developing frog, could produce local postsynaptic alterations in protein synthesis by inducing eEF2 phosphorylation.

**Panel 2D Summary:** Ag2900 The CG56633-01 gene is expressed at increased levels in colon, breast and bladder cancers compared to the normal adjacent tissue samples. Therefore, expression of this gene could be of use as a marker for these cancers.

**Panel 4D Summary:** Ag2900 The CG56633-01 gene is expressed in a number of preparations of activated T lymphocytes at levels greater than in resting T cells. Therefore, small molecule antagonists of the CG56633-01 gene product may reduce T cell activation and thus reduce or eliminate the symptoms in patients with autoimmune and inflammatory diseases, such as Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

#### NOV60a and NOV60b

Expression of gene NOV60a and variant NOV60b was assessed using the primer-probe sets Ag041b and Ag41, described in Tables BCA and BCB. Results of the RTQ-PCR runs are shown in Tables BCC, BCD, BCE, BCF, BCG, BCH and BCI.

**Table BCA. Probe Name Ag041b**

5 **CNS\_neurodegeneration\_v1.0 Summary:** Ag041b This panel does not show differential expression of the NOV60a gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1 Summary:** Ag41 Two experiments with the same probe and primer set produce results that are in reasonable agreement, with highest expression of the NOV60a gene in the mammary gland and the brain. Overall, this gene appears to express in normal tissues at

higher levels than in cancer cell lines. This gene encodes a lynx1 homolog. Lynx1 is an endogenous toxin-like modulator of nicotinic acetylcholine receptors in the mammalian CNS. Activation of nicotinic receptors is associated with positive effect on schizophrenia and alzheimer's disease. Therefore, agents that block Ag41 action in the CNS are likely to have utility in the treatment of these, and related, disorders.

This gene also has high levels of expression in pancreas, adrenal, thyroid, pituitary, heart, skeletal muscle and liver. Therefore, therapeutic modulation of this gene product may be a treatment for endocrine and metabolic diseases, including obesity and Types 1 and 2 diabetes. Please note that two additional experiments with the same probe and primer set show low/undetectable levels of expression (CTs>35). (Data not shown.) The results indicate that there is a possibility of a probe failure.

#### References:

Miwa JM, Ibanez-Tallon I, Crabtree GW, Sanchez R, Sali A, Role LW, Heintz N. lynx1, an endogenous toxin-like modulator of nicotinic acetylcholine receptors in the mammalian CNS. Neuron 1999 May;23(1):105-14

Elapid snake venom neurotoxins exert their effects through high-affinity interactions with specific neurotransmitter receptors. A novel murine gene, lynx1, is highly expressed in the brain and contains the cysteine-rich motif characteristic of this class of neurotoxins. Primary sequence and gene structure analyses reveal an evolutionary relationship between lynx1 and the Ly-6/neurotoxin gene family. lynx1 is expressed in large projection neurons in the hippocampus, cortex, and cerebellum. In cerebellar neurons, lynx1 protein is localized to a specific subdomain including the soma and proximal dendrites. lynx1 binding to brain sections correlates with the distribution of nAChRs, and application of lynx1 to Xenopus oocytes expressing nAChRs results in an increase in acetylcholine-evoked macroscopic currents. These results identify lynx1 as a novel protein modulator for nAChRs in vitro, which could have important implications in the regulation of cholinergic function in vivo.

**Panel 1.1 Summary:** Ag041b The NOV60a gene is expressed in most cell lines and normal tissues with a significantly higher level of expression in normal brain and heart compared to cancer cell lines on this panel. The results in this panel are consistent with expression in Panel 1. Please see Panel 1 for further discussion of utility of this gene in metabolic and cns diseases and cancer.

**Panel 1.3D Summary:** Ag041b Highest expression of the NOV60a gene is seen in the brain. Overall, this gene is expressed in most cell lines and normal tissues with a significantly higher level of expression in heart in addition to brain when compared to cancer cell lines on

this panel. Please see Panel 1 for discussion of utility of this gene in the central nervous system.

Among metabolic tissues, this gene has a low level of expression in adipose, adult and fetal liver, adrenal, pituitary, fetal skeletal muscle, fetal and adult heart, thyroid and pancreas. Therefore, modulation of this gene product may be a treatment for endocrine and metabolic diseases, including obesity and Types 1 and 2 diabetes. In addition, this gene differentially expressed in fetal (CT value = 29) vs adult skeletal muscle (CT value = 35) and may be useful for the identification of the two sources of this tissue.

**Panel 2D Summary: Ag041b/Ag41** The expression of the NOV60a gene was assessed in two independent runs on this panel with good concordance between runs. This protein is a good diagnostic marker and target in ovarian, renal and liver cancer as the cancer expressed this gene at a higher level than the normal adjacent tissue.

**Panel 3D Summary: Ag041b/Ag41** Two experiments show expression of the NOV60a gene in cell lines derived from brain, lung, ovarian, renal, pancreatic, breast and osteosarcoma. Therefore, expression of this gene could be used as a diagnostic marker for the presence of these cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of brain, lung, ovarian, renal, pancreatic, breast and osteosarcoma cancers.

**Panel 4D Summary: Ag041b** The NOV60a gene, a lynx1 homolog is expressed at moderate levels in untreated lung fibroblasts, lung fibroblasts activated with IL-4, IL-9 or IFN gamma, and dermal fibroblasts activated with IL-4 (CTs=30). Therefore, small molecules or therapeutic antibodies that antagonize the function of the NOV60a gene product may be useful to reduce or eliminate the symptoms in patients with chronic obstructive pulmonary disease, asthma, emphysema, or psoriasis.

## 25 NOV61: Adlican-like

Expression of gene NOV61 was assessed using the primer-probe sets Ag2933, Ag3370 and Ag3837, described in Tables BDA, BDB and BDC.

**Table BDA. Probe Name Ag2933**

| Reverse | 5'-gcttcttctctggtgaaatgg-3'                    | 20     | 3784           | 1245       |

5 **CNS\_neurodegeneration\_v1.0 Summary:** Ag2933/Ag3370 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**General\_screening\_panel\_v1.4 Summary:** Ag3370/Ag3837 The amp plots suggest that there were experimental difficulties with these runs (data not shown).

**Panel 1.3D Summary:** Ag2933 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 2D Summary:** Ag2933 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4D Summary:** Ag2933/Ag3370 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

## 15 **BE. CG56781-01: NEUROPSIN PRECURSOR**

Expression of gene CG56781-01 was assessed using the primer-probe sets Ag3019 and Ag4966, described in Tables BEA and BEB.

**Table BEA. Probe Name Ag3019**

| Primers | Sequences                                     | Length | Start Position | SEQ ID NO: |
|---------|-----------------------------------------------|--------|----------------|------------|
| Forward | 5'-aggatctgagcctgtgttcag-3'                   | 21     | 714            | 1246       |
| Probe   | TET-5'-cggagaccgctgtctacactaacgt-3'-<br>TAMRA | 26     | 739            | 1247       |
| Reverse | 5'-ttcaatccactccaggtagtc-3'                   | 22     | 768            | 1248       |

20

**Table BEB. Probe Name Ag4966**

| Primers | Sequences | Length | Start | SEQ ID NO: |
|---------|-----------|--------|-------|------------|
|---------|-----------|--------|-------|------------|

|         |                                           |    | Position |      |
|---------|-------------------------------------------|----|----------|------|
| Forward | 5'-ccaccctcttctcagag-3'                   | 18 | 7        | 1249 |
| Probe   | TET-5'-caccctgtgcaatccagcctg-3'-<br>TAMRA | 22 | 44       | 1250 |
| Reverse | 5'-acacctgcccacgctc-3'                    | 16 | 89       | 1251 |

5 **CNS\_neurodegeneration\_v1.0 Summary:** Ag3019 The amp plot suggests that there were experimental difficulties with this run in one sample (data not shown). Given the lack of expression of this gene on the other panels the expression detected in the occipital cortex is likely artifactual.

**Panel 1.3D Summary:** Ag3019 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4.1D Summary:** Ag3019 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

10 **Panel 4D Summary:** Ag3019 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 5 Islet Summary:** Ag3019 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

## NOV63

15 Expression of gene NOV63 was assessed using the primer-probe sets Ag2261 and Ag3035, described in Tables BFA and BFB. Results of the RTQ-PCR runs are shown in Tables BFC, BFD, BFE and BFF.

**Table BFA. Probe Name Ag2261**

| Primers | Sequences                                   | Length | Start Position | SEQ ID NO: |

**Panel 1.3D Summary:** Ag2261 The NOV63 gene is expressed at moderate levels in a number of metabolic tissues, with highest overall expression seen in fetal skeletal muscle (CTs=30.4-31.8). The higher levels of expression in fetal skeletal muscle when compared to adult skeletal muscle suggests that the protein product encoded by the 88091010\_EXT gene may be useful in treating muscular dystrophy, Lesch-Nyhan syndrome, myasthenia gravis and other conditions that result in weak or dystrophic muscle. This gene is also expressed in

adipose, thyroid and heart. Since biologic cross-talk between adipose and thyroid is a component of some forms of obesity, this gene product may be a protein therapeutic for the treatment of metabolic disease, including obesity and Type 2 diabetes.

Ag3035 This probe/primer set recognizes a distinct portion of this gene and shows a distinctive expression pattern when compared to Ag2261. This observation may indicate that the probe/primer sets can distinguish splice variants of this gene. In contrast to the results obtained with Ag 2261, expression of this gene is highest in an ovarian cancer cell line (CT = 30.6). As is the case for Ag2261, expression of this gene using Ag3035 also shows relatively high levels in fetal skeletal muscle. However, in addition, Ag3035 shows increased levels of this gene in adult skeletal muscle as well as in adult and fetal heart. Most other expression is similar using both probe/primer sets. Please see Ag2261 for additional information.

**Panel 2D Summary:** Ag2261 The expression of this gene was assessed in two independent runs on panel 2D. This is consistently expressed in samples of breast cancer, uterine cancer and lung cancer when compared to their respective normal adjacent tissue controls. Thus, the expression of this gene could be used to distinguish breast cancer, lung cancer or uterine cancer from their normal tissues. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, antibodies or protein therapeutics might be of use in the treatment of breast, lung or uterine cancer.

**Panel 4.1D Summary:** Ag3035 This probe/primer set recognizes a distinct portion of this gene and shows a distinctive expression pattern when compared to Ag2261 in Panel 4D. This observation may indicate that the probe/primer sets can distinguish splice variants of this gene. In contrast to the results obtained with Ag2261, expression of this gene is highest in kidney (CT = 30.6). Most other expression is similar using both probe/primer sets. The NOV63 gene, a WNT-14 homolog is also expressed at moderate to low levels in several unstimulated or cytokine-activated keratinocyte and lung and dermal fibroblast preparations (CT range 29-34). Thus, the NOV63 gene may be useful as a protein therapeutic that reduces or eliminates the symptoms of chronic obstructive pulmonary disease, asthma, emphysema, or psoriasis. In addition, due to its known effects on development of vertebrate joints, the protein encoded by the NOV63 gene may also reduce or eliminate the symptoms of osetoarthritis (See Hartmann and Tabin, 2001).

#### References:

Christine Hartmann and Clifford J. Tabin Wnt-14 Plays a Pivotal Role in Inducing Synovial Joint Formation in the Developing Appendicular Skeleton Cell, Vol 104, 341-351, February 2001

The long bones of the vertebrate appendicular skeleton arise from initially continuous condensations of mesenchymal cells that subsequently segment and cavitate to form discrete elements separated by synovial joints. Little is known, however, about the molecular mechanisms of joint formation. We present evidence that Wnt-14 plays a central role in initiating synovial joint formation in the chick limb. Wnt-14 is expressed in joint-forming regions prior to the segmentation of the cartilage elements, and local misexpression of Wnt-14 induces morphological and molecular changes characteristic of the first steps of joint formation. Induction of an ectopic joint-like region by Wnt-14 suppresses the formation of the immediately adjacent endogenous joint, potentially providing insight into the spacing of joints.

**Panel 4D Summary:** Ag2261 The NOV63 transcript is expressed at low levels in colon (CT=33.5). Low but significant levels of expression are also found in the lung, keratinocytes and dermal fibroblast. Thus, this transcript could be used as a marker for thymic, lung and skin tissues. The putative Wnt-14 molecule encoded by this transcript may play an important role in the normal homeostasis of these tissues. Therapeutics designed with the protein encoded by this transcript could be important for maintaining or restoring normal function to these organs during inflammation.

#### NOV64

Expression of gene NOV64 was assessed using the primer-probe set Ag3043, described in Table BGA. Results of the RTQ-PCR runs are shown in Tables BGB, BGC and BGD.

**Table BGA. Probe Name Ag3043**

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3043 There is an association with a statistical confidence of 0.1 between increased expression of the NOV64 gene in the temporal cortex and Alzheimer's disease. This gene encodes a homolog of dipeptidyl peptidase, which belongs to a known class of markers of T cell activation in Multiple Sclerosis. This indicates that inhibitors of this gene product may have utility in treatment of this disease. A dipeptidyl peptidase is also dysregulated in Huntington's disease. Our finding of increased expression of this gene product in the temporal cortex of Alzheimer's disease patients indicates that there may be a wider utility of inhibitors of the protein encoded by this gene, including the treatment of neurodegenerative diseases such as Huntington's and Alzheimer's, as well as Multiple Sclerosis.

Khoury SJ, Guttman CR, Orav EJ, Kikinis R, Jolesz FA, Weiner HL. Changes in activated T cells in the blood correlate with disease activity in multiple sclerosis. Arch Neurol 2000 Aug;57(8):1183-9

**OBJECTIVE:** To determine whether changes in activation markers on peripheral blood T cells correlate with disease activity in patients with multiple sclerosis. **DESIGN:** In a prospective longitudinal study during 1 year, we analyzed the change in percentage of activated T lymphocytes in the peripheral blood of 40 patients with multiple sclerosis in relation to clinical findings and changes on brain magnetic resonance imaging (MRI) scans. The patients underwent repeated imaging of the brain (mean number of MRIs for each patient, 22) at the time blood samples were obtained as well as at monthly neurological examinations, and at the time of scoring on the Kurtzke Expanded Disability Status Scale (EDSS) and

ambulation index scale. RESULTS: A change in the percentage of cells expressing the activation markers interleukin 2 receptor (CD25), class II major histocompatibility complex (MHC) (I3) or surface dipeptidyl peptidase (CD26) correlated significantly with a change in lesion volume or a change in number of gadolinium-enhancing lesions as detected on MRI.

- 5 Changes in CD25(+) cells and in CD4(+) cells expressing class II MHC also correlated with changes in disability as measured by EDSS in patients with relapsing-remitting disease, and changes in CD4(+)CD25(+) cells correlated with the occurrence of attacks in patients with relapsing-remitting disease. These correlations are dependent on measurement of changes between time points sampled at 1- or 2-week intervals. CONCLUSION: There is a linkage  
10 between peripheral T-lymphocyte activation as measured by cell surface markers and disease activity in patients with multiple sclerosis.

Mantle D, Falkous G, Ishiura S, Perry RH, Perry EK. Comparison of cathepsin protease activities in brain tissue from normal cases and cases with Alzheimer's disease, Lewy body dementia, Parkinson's disease and Huntington's disease. J Neurol Sci 1995 Jul;131(1):65-  
15 70

- Recent evidence, based upon immunocytochemical and histochemical analysis of brain cortical tissue from alzheimer's disease patients, has suggested that altered activity and/or distribution of the lysosomal proteases cathepsins B and D may be implicated in the abnormal protein processing pathway resulting in formation of the neurotoxic amyloid A4 peptide,  
20 characteristic of this neurodegenerative disorder. We have therefore compared, via biochemical assay techniques using conventional or specially synthesised (corresponding to protein cleavage points of relevant to A4 peptide formation) fluorogenic substrates, the levels of activity of the lysosomal proteases cathepsins B, D, H and L, and dipeptidyl aminopeptidases I and II in frontal cortex (grey/white matter) from control and Alzheimer's  
25 disease patients. For comparative purposes, activity levels of the above enzymes were also determined in frontal cortex tissue from cases with Lewy body dementia and Parkinson's disease, and in caudate tissue from control and Huntington's disease cases. There was no significant difference in activity for any protease types in tissue from control cases and cases with Alzheimer's disease, Lewy body dementia or Parkinson's disease, with the exception of  
30 reduced dipeptidyl aminopeptidase II activity in Lewy body dementia and Parkinson's cases. We have therefore been unable to confirm a potential role for lysosomal cathepsins in the characteristic neurodegeneration associated with Alzheimer's disease; however the finding of significant increases in activity of dipeptidyl aminopeptidase II, cathepsin H and cathepsin D specifically in cases with Huntington's disease is of particular note. We therefore suggest the

potential role of the latter enzymes in the pathogenesis of Huntington's disease requires further investigation

**Panel 1.3D Summary:** Ag3043 Highest expression of the NOV64 gene is seen in an ovarian cancer cell line (CT=26.2). This gene is expressed at moderate levels in all the cancer cell lines in this panel. Thus, this is a potential target for small molecule inhibitor drugs in cancer.

This gene also has moderate levels of expression in pancreas, adrenal, thyroid, pituitary, heart, skeletal muscle, liver and adipose. Therefore, this gene product may be a small molecule target for the treatment of metabolic and endocrine diseases, including obesity and Types 1 and 2 diabetes.

In addition, this gene is expressed in the central nervous system. Please see CNS\_neurodegeneration\_v1.0 for discussion of utility of this gene in the central nervous system.

**Panel 4D Summary:** Ag3043 The NOV64 gene is expressed in a number of cells and tissues of immunological importance, especially in activated B cells, T cells, dendritic cells, and activated lung and skin fibroblasts. Therefore, small molecule antagonists that block the function of the NOV64 gene product may reduce or eliminate the symptoms of a wide range of autoimmune and inflammatory diseases, including Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

#### NOV65a and NOV65b

Expression of gene NOV65a and variant NOV65b was assessed using the primer-probe sets Ag3020 and Ag2968, described in Tables BHA and BHB. Results of the RTQ-PCR runs are shown in Tables BHC, BHD, BHE, BHF and BHG.

**General\_screening\_panel\_v1.4 Summary:** Ag3020 The NOV65a gene is expressed in brain, colon, lung and ovarian cancer cell lines with highest expression in a colon cancer cell line Colo-205 (CT=24.37). This suggests that this gene can be used as a diagnostic marker for these types of cancer . Furthermore, inhibition of the protein using small molecule drugs could potentially be useful for the treatment of brain, colon, lung and ovarian cancer.

In addition, this gene has low expression in adipose and high expression in adult and fetal heart and skeletal muscle. Thus, this protein phosphatase may be a small molecule target for the treatment of obesity, Type 2 diabetes and cardiac and skeletal muscle disease.

**Panel 1.3D Summary:** Ag2968/Ag3020 Results from two experiments using identical probe/primer sets are in excellent agreement. Expression of the NOV65a gene is highest in adult skeletal muscle (CTs = 26-28). Significant but somewhat lower expression is also seen in fetal skeletal muscle and adult/fetal heart. Thus, expression of this gene may be used to distinguish these samples from the other samples on this panel.

This gene is also expressed in brain, colon, lung and ovarian cancer cell lines, consistent with General\_screening\_panel\_v1.4. This suggests that this gene can be used as a diagnostic marker for these types of cancer and inhibition of the protein using small molecule drugs can be used for the treatment of brain, colon, lung and ovarian cancer.

**Panel 3D Summary:** Ag2968 Expression of the NOV65a gene is highest in colon cancer cell line Colo-205 (CT = 25.6). In addition, significant expression of this gene is seen in two other colon cancer cell lines. Thus, expression of this gene may be used to distinguish these colon cancer cell lines from the other samples on this panel. Moreover, therapeutic modulation of the activity of this gene or its protein product, using small molecules, antibodies or protein therapeutics, may be of benefit in the treatment of colon cancer.

**Panel 4D Summary:** Ag3020 Expression of the NOV65a gene is highest in a liver cirrhosis sample (CT = 33.3). Furthermore, expression of this gene is not detected in normal liver in Panels 1.3D or 1.4, suggesting that its expression is unique to liver cirrhosis. This gene encodes a putative protein phosphatase; therefore, antibodies or small molecule therapeutics could reduce or inhibit fibrosis that occurs in liver cirrhosis. In addition, antibodies to this protein could also be used for the diagnosis of liver cirrhosis. Low levels of expression are also seen in colon and resting astrocytes.

Ag2968 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 5D Summary:** Ag3020 Expression of the NOV65a gene is primarily restricted to samples from skeletal muscle. This specific expression is in agreement with the results in  
 5 Panels 1.3D and 1.4. Thus, expression of this gene could be used to differentiate between skeletal muscle and other samples on this panel, and as a marker of skeletal muscle. Results from one experiment with the probe and primer set Ag2968 are not included. The amp plot indicates that there were experimental difficulties with this run.

### NOV66

10 Expression of gene NOV66 was assessed using the primer-probe set Ag2913, described in Table BIA. Results of the RTQ-PCR runs are shown in Tables BIB, BIC and BID.

**Table BIA. Probe Name Ag2913**

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2913 No significant expression detected. Potential failed chemistry reaction or bad probe/primer set (data not shown).

**Panel 1.3D Summary:** Ag2913 The NOV66 gene represents a novel G-protein coupled receptor (GPCR) with expression in the brain. The GPCR family of receptors contains a large number of neurotransmitter receptors, including the dopamine, serotonin,  $\alpha$  and  $\beta$ -adrenergic, acetylcholine muscarinic, histamine, peptide, and metabotropic glutamate receptors. GPCRs are excellent drug targets in various neurologic and psychiatric diseases. All antipsychotics have been shown to act at the dopamine D2 receptor; similarly novel antipsychotics also act at the serotonergic receptor, and often the muscarinic and adrenergic receptors as well. While the majority of antidepressants can be classified as selective serotonin reuptake inhibitors, blockade of the 5-HT<sub>1A</sub> and  $\alpha_2$  adrenergic receptors increases the effects of these drugs. The GPCRs are also of use as drug targets in the treatment of stroke. Blockade of the glutamate receptors may decrease the neuronal death resulting from excitotoxicity; furthermore the purinergic receptors have also been implicated as drug targets in the treatment of cerebral ischemia. The  $\beta$ -adrenergic receptors have been implicated in the treatment of ADHD with Ritalin, while the  $\alpha$ -adrenergic receptors have been implicated in memory. Therefore this gene may be of use as a small molecule target for the treatment of any of the described diseases.

In addition, this gene is expressed in clusters of cell lines derived from lung cancer and colon cancer. Thus, expression of this gene could be used to differentiate between these sample and other samples on this panel and as a marker to detect the presence of colon and lung cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of lung and colon cancers.

El Yacoubi M, Ledent C, Parmentier M, Bertorelli R, Ongini E, Costentin J, Vaugeois JM. Adenosine A<sub>2A</sub> receptor antagonists are potential antidepressants: evidence based on pharmacology and A<sub>2A</sub> receptor knockout mice. *Br J Pharmacol* 2001 Sep;134(1):68-77

1. Adenosine, an ubiquitous neuromodulator, and its analogues have been shown to produce 'depressant' effects in animal models believed to be relevant to depressive disorders, while adenosine receptor antagonists have been found to reverse adenosine-mediated 'depressant' effect. 2. We have designed studies to assess whether adenosine A2A receptor antagonists, or genetic inactivation of the receptor would be effective in established screening procedures, such as tail suspension and forced swim tests, which are predictive of clinical antidepressant activity. 3. Adenosine A2A receptor knockout mice were found to be less sensitive to 'depressant' challenges than their wildtype littermates. Consistently, the adenosine A2A receptor blockers SCH 58261 (1 - 10 mg kg<sup>-1</sup>), i.p.) and KW 6002 (0.1 - 10 mg kg<sup>-1</sup>), p.o.) reduced the total immobility time in the tail suspension test. 4. The efficacy of adenosine A2A receptor antagonists in reducing immobility time in the tail suspension test was confirmed and extended in two groups of mice. Specifically, SCH 58261 (1 - 10 mg kg<sup>-1</sup>) and ZM 241385 (15 - 60 mg kg<sup>-1</sup>) were effective in mice previously screened for having high immobility time, while SCH 58261 at 10 mg kg<sup>-1</sup> reduced immobility of mice that were selectively bred for their spontaneous 'helplessness' in this assay. 5. Additional experiments were carried out using the forced swim test. SCH 58261 at 10 mg kg<sup>-1</sup> reduced the immobility time by 61%, while KW 6002 decreased the total immobility time at the doses of 1 and 10 mg kg<sup>-1</sup> by 75 and 79%, respectively. 6. Administration of the dopamine D2 receptor antagonist haloperidol (50 - 200 microg kg<sup>-1</sup>) i.p.) prevented the antidepressant-like effects elicited by SCH 58261 (10 mg kg<sup>-1</sup>) i.p.) in forced swim test whereas it left unaltered its stimulant motor effects. 7. In conclusion, these data support the hypothesis that A2A receptor antagonists prolong escape-directed behaviour in two screening tests for antidepressants. Altogether the results support the hypothesis that blockade of the adenosine A2A receptor might be an interesting target for the development of effective antidepressant agents.

25 Blier P. Pharmacology of rapid-onset antidepressant treatment strategies. Clin Psychiatry 2001;62 Suppl 15:12-7

Although selective serotonin reuptake inhibitors (SSRIs) block serotonin (5-HT) reuptake rapidly, their therapeutic action is delayed. The increase in synaptic 5-HT activates feedback mechanisms mediated by 5-HT<sub>1A</sub> (cell body) and 5-HT<sub>1B</sub> (terminal) autoreceptors, which, respectively, reduce the firing in 5-HT neurons and decrease the amount of 5-HT released per action potential resulting in attenuated 5-HT neurotransmission. Long-term treatment desensitizes the inhibitory 5-HT<sub>1</sub> autoreceptors, and 5-HT neurotransmission is enhanced. The time course of these events is similar to the delay of clinical action. The addition of pindolol, which blocks 5-HT<sub>1A</sub> receptors, to SSRI treatment decouples the

feedback inhibition of 5-HT neuron firing and accelerates and enhances the antidepressant response. The neuronal circuitry of the 5-HT and norepinephrine (NE) systems and their connections to forebrain areas believed to be involved in depression has been dissected. The firing of 5-HT neurons in the raphe nuclei is driven, at least partly, by alpha1-adrenoceptor-mediated excitatory inputs from NE neurons. Inhibitory alpha2-adrenoceptors on the NE neuroterminals form part of a feedback control mechanism. Mirtazapine, an antagonist at alpha2-adrenoceptors, does not enhance 5-HT neurotransmission directly but disinhibits the NE activation of 5-HT neurons and thereby increases 5-HT neurotransmission by a mechanism that does not require a time-dependent desensitization of receptors. These neurobiological phenomena may underlie the apparently faster onset of action of mirtazapine compared with the SSRIs.

Tranquillini ME, Reggiani A. Glycine-site antagonists and stroke. *Expert Opin Investig Drugs* 1999 Nov;8(11):1837-1848

The excitatory amino acid, (S)-glutamic acid, plays an important role in controlling many neuronal processes. Its action is mediated by two main groups of receptors: the ionotropic receptors (which include NMDA, AMPA and kainic acid subtypes) and the metabotropic receptors (mGluR(1-8)) mediating G-protein coupled responses. This review focuses on the strychnine insensitive glycine binding site located on the NMDA receptor channel, and on the possible use of selective antagonists for the treatment of stroke. Stroke is a devastating disease caused by a sudden vascular accident. Neurochemically, a massive release of glutamate occurs in neuronal tissue; this overactivates the NMDA receptor, leading to increased intracellular calcium influx, which causes neuronal cell death through necrosis. NMDA receptor activation strongly depends upon the presence of glycine as a co-agonist. Therefore, the administration of a glycine antagonist can block overactivation of NMDA receptors, thus preserving neurones from damage. The glycine antagonists currently identified can be divided into five main categories depending on their chemical structure: indoles, tetrahydroquinolines, benzoazepines, quinoxalinediones and pyrida-zinoquinolines.

Monopoli A, Lozza G, Forlani A, Mattavelli A, Ongini E. Blockade of adenosine A2A receptors by SCH 58261 results in neuroprotective effects in cerebral ischaemia in rats. *Neuroreport* 1998 Dec 1;9(17):3955-9

Blockade of adenosine receptors can reduce cerebral infarct size in the model of global ischaemia. Using the potent and selective A2A adenosine receptor antagonist, SCH 58261, we assessed whether A2A receptors are involved in the neuronal damage following focal cerebral ischaemia as induced by occluding the left middle cerebral artery. SCH 58261 (0.01 mg/kg

either i.p. or i.v.) administered to normotensive rats 10 min after ischaemia markedly reduced cortical infarct volume as measured 24 h later (30% vs controls,  $p < 0.05$ ). Similar effects were observed when SCH 58261 (0.01 mg/kg, i.p.) was administered to hypertensive rats (28% infarct volume reduction vs controls,  $p < 0.05$ ). Neuroprotective properties of SCH 58261 administered after ischaemia indicate that blockade of A2A adenosine receptors is a potentially useful biological target for the reduction of brain injury.

**Panel 2D Summary:** Ag2913 The NOV66 gene is a diagnostic marker for gastric thyroid and bladder cancer and a target for therapeutic intervention in gastric, thyroid and bladder cancer through the use of antibodies or small molecule drugs. This is based on the expression profile of this gene that shows higher expression in some gastric, thyroid and bladder cancer samples compared to normal tissues.

**Panel 4D Summary:** Ag2913 The NOV66 gene, an olfactory receptor homolog is expressed at moderate levels in activated and resting T lymphocytes (CT range 30.13-32.98). Small molecules or therapeutic antibodies that antagonize the function of the NOV66 gene product may reduce or eliminate the symptoms of autoimmune and inflammatory diseases, including Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

**Panel CNS\_1 Summary:** Ag2913 No significant expression detected. Potential probe/primer failure (data not shown).

## 20 NOV67

Expression of gene NOV67 was assessed using the primer-probe set Ag2951, described in Table BJA. Results of the RTQ-PCR runs are shown in Tables BJB and BJC.

**AI\_comprehensive panel\_v1.0 Summary:** Ag2951 Highest expression of the NOV67 gene is seen in normal tissue adjacent to colon from an ulcerative colitis patient (CT=33).

Thus, expression of this gene could be used to distinguish this sample from other samples on this panel. Please see Panel 4D for further discussion of utility of this gene in inflammation.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2951 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 1.3D Summary:** Ag2951 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4.1D Summary:** Ag2951 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4D Summary:** Ag2951 The NOV67 gene is expressed at a moderate level (CT=32.78) in pokeweed mitogen-stimulated peripheral blood leukocytes, consisting primarily of activated B lymphocytes. Small molecule antagonists or therapeutic antibody antagonists that block the function of the CG56571-gene product may be useful in several autoimmune and inflammatory diseases in which activated B cells can play major roles as sources of autoantibody-producing cells and as powerful antigen-presenting cells, including, but not

limited to, Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

### NOV69a and NOV69b

5 Expression of gene NOV69a and variant NOV69b was assessed using the primer-probe sets Ag2460 and Ag349, described in Tables BKA and BKB. Results of the RTQ-PCR runs are shown in Tables BKC, BKD, BKE and BKF.

**Table BKA. Probe Name Ag2460**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|
| Forward | 5'-tcatagcagtcacgaggaa-3'                  | 19     | 89             | 1273       |
| Probe   | TET-5'-tcactattgccttaatctcatgcgca-3'-TAMRA | 26     | 125            | 1274       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2460 Expression of the NOV69a gene is low/undetectable in all samples on this panel (CTs>35). (Data not shown).

**Panel 1 Summary:** Ag349 Highest expression of the NOV69a gene is seen in a melanoma cell line (CT=28.7). Thus, expression of this gene could be used to differentiate  
5 between this sample and other samples on this panel. There is also significant expression in thymus. Please see Panel 4D for discussion of utility of this gene in autoimmunity.

**Panel 1.3D Summary:** Ag2460 Expression of the NOV69a gene is limited to a few samples that are all derived from normal tissue. Significant levels of expression are seen in mammary gland, trachea, stomach, thymus, and spinal cord. Thus, expression of this gene can  
10 be used to differentiate between these samples and other samples on this panel.

**Panel 2D Summary:** Ag2460 Expression of the NOV69a gene is limited to a few samples, with highest expression in a lung cancer (CT=27.5). Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of lung cancer. Furthermore, therapeutic modulation of the  
15 expression or function of this gene may be effective in the treatment of lung cancer.

**Panel 4D Summary:** Ag2460 The NOV69a gene encodes a homolog of the IL-1 epsilon. Interleukin 1 (IL-1) is a member of a large family of cytokines, which modulates immune and inflammatory responses. IL-1 molecules such as IL-1alpha, -beta, -delta, -gamma, and IL1-receptor agonist (IL-1ra) are typically secreted by macrophages,  
20 mononuclear cells, epithelial and endothelial cells. IL-1 molecules are first produced as precursors of about 30 kDa and do not contain a signal sequence. The IL-1 precursors are then proteolytically cleaved into their secreted active forms (~17 kDa). Their immuno-modulatory functions are mediated by two IL-1 receptors, which are members of the immunoglobulin superfamily. The biological functions of IL-1 include: activation of vascular endothelial cells  
25 to secrete IL-6, increase leukocyte adhesion and activate mononuclear phagocytes that activate inflammatory leukocytes; tissue destruction, and fever. Given the biological potency of the IL-1 family of proteins, a need exists to identify new members of this family as well as understand the biological function of its members. The high levels of expression of this gene in small airway epithelium activated by treatment with TNF-alpha + IL-1 beta(CT=28.9)  
30 indicate that CG56136-01 may play a substantial role in mediating inflammation in the lung. Thus, therapeutic targeting of CG56136-01 with a monoclonal antibody is anticipated to limit or block the extent of inflammation potential and thus the symptoms, caused by pro-inflammatory cytokines such as IL-1 epsilon, when these cytokines are induced in allergic, asthma and COPD patients.

Smith,D.E., Renshaw,B.R., Ketchem,R.R., Kubin,M., Garka,K.E. and Sims,J.E. Four new members expand the interleukin-1 superfamily J. Biol. Chem. 275 (2), 1169-1175 (2000)

Abstract: We report here the cloning and characterization of four new members of the  
 5 interleukin-1 (IL-1) family (FIL1delta, FIL1epsilon, FIL1zeta, and FIL1eta, with FIL1  
 standing for "Family of IL-1"). The novel genes demonstrate significant sequence similarity to  
 IL-1alpha, IL-1beta, IL-1ra, and IL-18, and in addition maintain a conserved exon-intron  
 arrangement that is shared with the previously known members of the family. Protein structure  
 modeling also suggests that the FIL1 genes are related to IL-1beta and IL-1ra. The novel genes  
 10 form a cluster with the IL-1s on the long arm of human chromosome 2.

**NOV71**

Expression of gene NOV71 was assessed using the primer-probe set Ag3049,  
 described in Table BLA. Results of the RTQ-PCR runs are shown in Tables BLB, BLC, BLD  
 and BLE.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3049 This panel does not show differential expression of the NOV71 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3049 The NOV71 gene is expressed at moderate to high levels in the cancer cell lines in this panel with the highest expression shown by a glioma cell line U251 (CT=26.6). Because normal tissues show a lower level of expression of this gene, expression of this gene might be used as a diagnostic marker for cancer. Furthermore, therapeutics designed using antibodies and small molecule inhibitors of this gene may be effective in the treatment of cancer.

Among tissues with metabolic function, this gene has moderate levels of expression in pancreas, adrenal, thyroid, pituitary, heart, skeletal muscle and adipose. Therefore, this gene product may be a small molecule target for the treatment of endocrine and metabolic diseases, including obesity, and Types 1 and 2 diabetes.

In addition, moderate expression of this gene in the CNS suggests a role for this gene product in brain processes. Inhibition of SODIUM/HYDROGEN EXCHANGER function in the brain is associated with the activity of several enzymes known to play a positive role in cell survival and learning and memory, such as PKA and PKC. Therefore, inhibitors of the protein encoded by this gene may have utility in mimicking the potentially therapeutic action of these enzymes in the treatment of neurodegenerative diseases including Alzheimer's and Parkinson's diseases, as well as in memory loss due to aging.

Am J Physiol Cell Physiol 2001 Oct;281(4):C1146-Acute inhibition of brain-specific Na(+)/H(+) exchanger isoform 5 by protein kinases A and C and cell shrinkage. Attaphitaya S, Nehrke K, Melvin JE.

Little is known of the functional properties of the mammalian, brain-specific Na(+)/H(+) exchanger isoform 5 (NHE5). Rat NHE5 was stably expressed in NHE-deficient PS120 cells, and its activity was characterized using the fluorescent pH-sensitive dye 2',7'-bis(2-carboxyethyl)-5(6)-carboxyfluorescein. NHE5 was insensitive to ethylisopropyl  
5 amiloride. The transport kinetics displayed a simple Michaelis-Menten relationship for extracellular Na(+) (apparent  $K(\text{Na}) = 27 \pm 5$  mM) and a Hill coefficient near 3 for the intracellular proton concentration with a half-maximal activity at an intracellular pH of 6.93  $\pm 0.03$ . NHE5 activity was inhibited by acute exposure to 8-bromo-cAMP or forskolin (which increases intracellular cAMP by activating adenylate cyclase). The kinase inhibitor H-  
10 89 reversed this inhibition, suggesting that regulation by cAMP involves a protein kinase A (PKA)-dependent process. In contrast, 8-bromo-cGMP did not have a significant effect on activity. The protein kinase C (PKC) activator phorbol 12-myristate 13-acetate inhibited NHE5, and the PKC antagonist chelerythrine chloride blunted this effect. Activity was also inhibited by hyperosmotic-induced cell shrinkage but was unaffected by a hyposmotic  
15 challenge. These results demonstrate that rat brain NHE5 is downregulated by activation of PKA and PKC and by cell shrinkage, important regulators of neuronal cell function.

**Panel 2.2 Summary:** Ag3049 The NOV71 gene can be used as a diagnostic marker for stomach, breast, lung, ovarian and some colon cancers as expression in the normal adjacent tissue and the tumor tissue differs. Antibodies and small molecule inhibitors designed with this  
20 gene product may also be used for therapy in breast, lung, ovarian and some colon cancers.

**Panel 4D Summary:** Ag3049 The NOV71 gene, a sodium/hydrogen Exchanger homolog is expressed at a high level in Ramos (B cell) activated with ionomycin ( $\text{CT}=24.72$ ), and at a moderate to high level in other activated B cell preparations. Therefore, small molecule antagonists or therapeutic antibody antagonists that block the function of the NOV71  
25 gene product may be useful in several autoimmune and inflammatory diseases in which activated B cells can play major roles as sources of autoantibody-producing cells and also as powerful antigen-presenting cells, including, but not limited to, Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

#### 30 NOV72: UBIQUITIN-SPECIFIC PROTEASE

Expression of gene NOV72 was assessed using the primer-probe set Ag3050, described in Table BMA. Results of the RTQ-PCR runs are shown in Tables BMB, BMC, BMD and BME.

Table BMA. Probe Name Ag3050

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3050 This panel does not show differential expression of the NOV72 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3050 The NOV72 gene exhibits brain-preferential expression and is a member of a family of proteins that mediates ubiquitin-mediated protein degradation. Misprocessing of proteins involved in ubiquitin-mediated protein degradation is thought to be the cause of many neurodegenerative disorders such as Parkinson's disease, as well as those resulting from CAG repeat expansion genes, such as Huntington's disease. Therefore, therapeutic modulation of the expression or function of this gene may affect the protein degradation dysfunction seen in these diseases.

In addition, this gene is expressed at a slightly higher level in cancer cell lines compared to the normal lung, ovary, breast, and colon samples on this panel. This suggests that expression of this gene could be used as a diagnostic marker of cancer. Furthermore, inhibition of this gene product using small molecule drugs may be useful in the treatment of cancer in these tissues.

Among tissues with metabolic function, this gene is has a low level of expression in pancreas, thyroid, pituitary, heart, skeletal muscle, and adipose. This gene product may be a

small molecule target for the treatment of metabolic and endocrine diseases, including obesity and Types 1 and 2 diabetes.

**Panel 4D Summary:** Ag3050 The NOV72 gene is expressed at moderate to low levels (CT=29-34) in a wide range of cell types and tissues of significance in the immune response in health and disease, Highest expression of this gene is seen in kidney tissue (CT=29.36).

Therefore, targeting of this gene product with a small molecule drug or antibody therapeutic may modulate the functions of cells of the immune system as well as resident tissue cells and lead to improvement of the symptoms of patients suffering from autoimmune and inflammatory diseases such as asthma, allergies, inflammatory bowel disease, lupus erythematosus, and arthritis, including osteoarthritis and rheumatoid arthritis.

**Panel CNS\_1 Summary:** Ag3050 This panel confirms expression of the NOV72 gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

## NOV73

Expression of gene NOV73 was assessed using the primer-probe set Ag3030, described in Table BNA.

**Table BNA. Probe Name Ag3030**

| Primers | Sequences                                   | Length | Start Position | SEQ ID NO: |
|---------|---------------------------------------------|--------|----------------|------------|
| Forward | 5'-tgaaattcagaaccaggaaatg-3'                | 22     | 838            | 1285       |
| Probe   | TET-5'-aaagagtgccttagcaggcacctccct-3'-TAMRA | 26     | 872            | 1286       |
| Reverse | 5'-aacctggcaatatgattcata-3'                 | 22     | 914            | 1287       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3030 Expression of this gene is low/undetectable (CTs > 34.5) across all of the samples on this panel (data not shown).

**Panel 1.3D Summary:** Ag3030 Expression of this gene is low/undetectable (CTs > 34.5) across all of the samples on this panel (data not shown).

**Panel 2D Summary:** Ag3030 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 3D Summary:** Ag3030 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4D Summary:** Ag3030 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 5 Islet Summary:** Ag3030 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

#### NOV74

5 Expression of gene NOV74 was assessed using the primer-probe set Ag3016, described in Table BOA. Results of the RTQ-PCR runs are shown in Tables BOB, BOC, BOD and BOE.

**Table BOA. Probe Name Ag3016**

| Primers | Sequences                               | Length | Start Position | SEQ ID NO: |
|---------|-----------------------------------------|--------|----------------|------------|
| Forward | 5'-atctcagtgacctgctctcaga-3'            | 22     | 83             | 1288       |

5 **CNS\_neurodegeneration\_v1.0 Summary:** Ag3016 This panel does not show differential expression of the NOV74 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

10 **Panel 1.3D Summary:** Ag3016 The NOV74 gene represents a dual specificity phosphatase that is expressed preferentially at low to moderate levels across the CNS. Dual-specificity phosphatases comprise a family of MAP kinase regulating enzymes, members of which are upregulated in brains subjected to insults such as ischemia and seizure activity. MAP kinases are known to regulate neurotrophic and neurotoxic pathways. Consequently,

agents that modulate the activity of this gene may have utility in attenuating the apoptotic and neurodegenerative processes following brain insults.

In addition, there are low but significant levels of expression in samples derived from breast cancer, ovarian cancer, and melanoma cell lines. Thus, expression of this gene could be  
5 used to differentiate between these samples and other samples on this panel and as a marker to detect the presence of these cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of breast cancer, ovarian cancer, and melanoma.

#### References:

10 Wiessner C. The dual specificity phosphatase PAC-1 is transcriptionally induced in the rat brain following transient forebrain ischemia. *Brain Res Mol Brain Res* 1995 Feb;28(2):353-6

PAC-1 mRNA has previously been found only in activated T-cells in vitro and in vivo. The gene encodes a dual specificity protein phosphatase that regulates MAP kinase activity.  
15 Here, I describe that PAC-1 mRNA is induced also in neurons in the rat brain following 30 min of forebrain ischemia. At 6, 12 and 24 h after ischemia, PAC-1 mRNA was found most prominently in hippocampal cells which are resistant to 30 min of forebrain ischemia, but not in the selectively vulnerable CA1 sector. At later time points and in control animals no PAC-1 mRNA could be detected in any brain region. The protein-tyrosine/threonine phosphatase  
20 PAC-1, therefore, may be involved in adaptational responses of hippocampal cells resistant to ischemic injury.

Boschert U, Muda M, Camps M, Dickinson R, Arkininstall S. Induction of the dual specificity phosphatase PAC1 in rat brain following seizure activity. *Neuroreport* 1997 Sep 29;8(14):3077-80

25 Recurrent seizure activity leads to delayed neuronal death as well as to inflammatory responses involving microglia in hippocampal subfields CA1, CA3 and CA4. Since mitogen activated protein (MAP) kinases control neuronal apoptosis and trigger generation of inflammatory cytokines, their activation state could determine seizure-related brain damage. PAC1 is a dual specificity protein phosphatase inactivating MAP kinases which we have  
30 found to be undetectable in normal brain. Despite this, kainic acid-induced seizure activity lead to rapid (approximately 3 h) but transient appearance of PAC1 mRNA in granule cells of the dentate gyrus as well as in pyramidal CA1 neurons. This pattern changed with time and after 2-3 days PAC1 was induced in dying CA1 and CA3 neurons. At this time PAC1 mRNA was also expressed in white matter microglia as well as in microglia invading the damaged

hippocampus. PAC1 may play an important role controlling MAP kinase involvement in both neuronal death and neuro-inflammation following excitotoxic damage.

**Panel 4D Summary:** Ag3016 The NOV74 gene is only expressed at detectable levels in the kidney (CT = 34.2) among the samples on this panel. Thus, expression of this gene could be used to distinguish kidney from the other samples on this panel. In addition, the dual-specificity protein phosphatase encoded for by this gene could allow cells within the kidney to respond to specific microenvironmental signals. Furthermore, small molecule therapies designed with the protein encoded for by this gene could modulate kidney function and be important in the treatment of inflammatory or autoimmune diseases that affect the kidney, including lupus and glomerulonephritis.

**Panel CNS\_1 Summary:** Ag3016 This panel confirms expression of the NOV74 gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

#### NOV75

Expression of gene NOV75 was assessed using the primer-probe sets Ag3020 and Ag2968, described in Tables BPA and BPB. Results of the RTQ-PCR runs are shown in Tables BPC, BPD, BPE, BPF and BPG.

**Table BPA. Probe Name Ag3020**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |

**General\_screening\_panel\_v1.4 Summary:** Ag3020 The NOV75 gene is expressed in brain, colon, lung and ovarian cancer cell lines with highest expression in a colon cancer cell line Colo-205 (CT=24.37). This suggests that this gene can be used as a diagnostic marker for these types of cancer. Furthermore, inhibition of the protein using small molecule drugs could potentially be useful for the treatment of brain, colon, lung and ovarian cancer.

In addition, this gene has low expression in adipose and high expression in adult and fetal heart and skeletal muscle. Thus, this protein phosphatase may be a small molecule target for the treatment of obesity, Type 2 diabetes and cardiac and skeletal muscle disease.

**Panel 1.3D Summary:** Ag2968/Ag3020 Results from two experiments using identical probe/primer sets are in excellent agreement. Expression of the NOV75 gene is highest in adult skeletal muscle (CTs = 26-28). Significant but somewhat lower expression is also seen in fetal skeletal muscle and adult/fetal heart. Thus, expression of this gene may be used to distinguish these samples from the other samples on this panel.

This gene is also expressed in brain, colon, lung and ovarian cancer cell lines, consistent with General\_screening\_panel\_v1.4. This suggests that this gene can be used as a diagnostic marker for these types of cancer and inhibition of the protein using small molecule drugs can be used for the treatment of brain, colon, lung and ovarian cancer.

**Panel 3D Summary:** Ag2968 Expression of the NOV75 gene is highest in colon cancer cell line Colo-205 (CT = 25.6). In addition, significant expression of this gene is seen in two other colon cancer cell lines. Thus, expression of this gene may be used to distinguish these colon cancer cell lines from the other samples on this panel. Moreover, therapeutic modulation of the activity of this gene or its protein product, using small molecules, antibodies or protein therapeutics, may be of benefit in the treatment of colon cancer.

**Panel 4D Summary:** Ag3020 Expression of the NOV75 gene is highest in a liver cirrhosis sample (CT = 33.3). Furthermore, expression of this gene is not detected in normal liver in Panels 1.3D or 1.4, suggesting that its expression is unique to liver cirrhosis. This gene encodes a putative protein phosphatase; therefore, antibodies or small molecule therapeutics could reduce or inhibit fibrosis that occurs in liver cirrhosis. In addition, antibodies to this protein could also be used for the diagnosis of liver cirrhosis. Low levels of expression are also seen in colon and resting astrocytes.

Ag2968 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 5D Summary:** Ag3020 Expression of the NOV75 gene is primarily restricted to samples from skeletal muscle. This specific expression is in agreement with the results in  
 5 Panels 1.3D and 1.4. Thus, expression of this gene could be used to differentiate between skeletal muscle and other samples on this panel, and as a marker of skeletal muscle.

#### NOV76a

Expression of gene NOV76a was assessed using the primer-probe sets Ag3022 and Ag4891, described in Tables BQA and BQB. Results of the RTQ-PCR runs are shown in  
 10 Tables BQC and BQD.

**Table BQA. Probe Name Ag3022**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3022 No significant expression detected. The amp plot indicates that there is possibility of a potential chemistry or probe/primer failure (data not shown).

5        **General\_screening\_panel\_v1.4 Summary:** Ag3022 The amp plot indicates that there is possibility of a potential chemistry or probe/primer failure (data not shown).

**General\_screening\_panel\_v1.5 Summary:** Ag4891 The NOV76a gene has moderate levels of expression in adipose, liver, heart, skeletal muscle, pituitary, thyroid and pancreas, and high levels of expression in adrenal gland. Thus, this gene product may be a small  
10        molecule target for the treatment of metabolic, endocrine and adrenal diseases, including obesity, Types 1 and 2 diabetes, and Addison's disease.

         In addition, this gene is expressed at moderate levels in the cancer cell lines in this panel. A higher level of expression is observed in colon, lung, breast and ovarian cancer cell lines when compared to samples from the normal colon, lung, breast and ovary. Thus, this  
15        gene could be used as a diagnostic marker of cancer in these tissues. Furthermore, inhibition of the activity of this gene product using small molecule drugs may be useful for the treatment of cancer in these tissues.

         This gene encodes a homolog of a dual specificity phosphatase that is also expressed at low to moderate levels across the CNS. Dual-specificity phosphatases comprise a family of  
20        MAP kinase regulating enzymes, members of which are upregulated in brains subjected to insults such as ischemia and seizure activity. MAP kinases are known to regulate neurotrophic and neurotoxic pathways. Consequently, agents that modulate the activity of this gene may have utility in attenuating the apoptotic and neurodegenerative processes following brain insults.

25        **References:**

         Wiessner C. The dual specificity phosphatase PAC-1 is transcriptionally induced in the rat brain following transient forebrain ischemia. Brain Res Mol Brain Res 1995 Feb;28(2):353-6

         PAC-1 mRNA has previously been found only in activated T-cells in vitro and in vivo.  
30        The gene encodes a dual specificity protein phosphatase that regulates MAP kinase activity. Here, I describe that PAC-1 mRNA is induced also in neurons in the rat brain following 30 min of forebrain ischemia. At 6, 12 and 24 h after ischemia, PAC-1 mRNA was found most prominently in hippocampal cells which are resistant to 30 min of forebrain ischemia, but not

in the selectively vulnerable CA1 sector. At later time points and in control animals no PAC-1 mRNA could be detected in any brain region. The protein-tyrosine/threonine phosphatase PAC-1, therefore, may be involved in adaptational responses of hippocampal cells resistant to ischemic injury.

- 5           Boschert U, Muda M, Camps M, Dickinson R, Arkinstall S. Induction of the dual specificity phosphatase PAC1 in rat brain following seizure activity. *Neuroreport* 1997 Sep 29;8(14):3077-80

Recurrent seizure activity leads to delayed neuronal death as well as to inflammatory responses involving microglia in hippocampal subfields CA1, CA3 and CA4. Since mitogen  
10   activated protein (MAP) kinases control neuronal apoptosis and trigger generation of inflammatory cytokines, their activation state could determine seizure-related brain damage. PAC1 is a dual specificity protein phosphatase inactivating MAP kinases which we have found to be undetectable in normal brain. Despite this, kainic acid-induced seizure activity lead to rapid (approximately 3 h) but transient appearance of PAC1 mRNA in granule cells of  
15   the dentate gyrus as well as in pyramidal CA1 neurons. This pattern changed with time and after 2-3 days PAC1 was induced in dying CA1 and CA3 neurons. At this time PAC1 mRNA was also expressed in white matter microglia as well as in microglia invading the damaged hippocampus. PAC1 may play an important role controlling MAP kinase involvement in both neuronal death and neuro-inflammation following excitotoxic damage.

- 20           **Panel 4.1D Summary:** Ag4891 The NOV76a gene is expressed in a wide range of cell types and tissues (CT=26-34) of significance in the immune response in health and disease. Highest expression of this gene is detected in activated secondary Th2 cells (CT=26.48). Therefore, targeting of this gene product with a small molecule drug or antibody therapeutic may modulate the functions of cells of the immune system as well as resident tissue cells and  
25   lead to improvement of the symptoms of patients suffering from autoimmune and inflammatory diseases such as asthma, allergies, inflammatory bowel disease, lupus erythematosus, and arthritis, including osteoarthritis and rheumatoid arthritis.

**Panel 4D Summary:** Ag3022 No significant expression detected. Potential probe/primer failure (data not shown).

- 30   NOV77

Expression of gene NOV77 was assessed using the primer-probe sets Ag3023 and Ag3373, described in Tables BRA and BRB. Results of the RTQ-PCR runs are shown in Tables BRC, BRD, BRE and BRF.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3023/Ag3373 This panel does not show differential expression of the NOV77 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**General\_screening\_panel\_v1.4 Summary:** Ag3373 Highest expression of the NOV77 gene is seen in a prostate cancer cell line (CT=27). Overall, this gene is expressed at

moderate levels in the cancer cell lines in this panel. A higher level of expression is observed in clusters of cell lines derived from prostate, brain, melanoma, colon, lung, breast and ovarian cancer when compared to expression in normal prostate, brain, colon, lung, breast and ovary. Thus, this gene could potentially be used as a diagnostic marker of cancer in these tissues.

- 5 Furthermore, inhibition of the activity of this gene product using small molecule drugs may be effective in the treatment of cancer in these tissues.

Among tissues with metabolic function, this gene product has moderate levels of expression in adipose, heart, skeletal muscle, adrenal, pituitary, thyroid and pancreas. Thus, this gene product may be a small molecule target for the treatment of endocrine and metabolic  
10 diseases, including obesity and Types 1 and 2 diabetes.

In addition, this gene appears to be differentially expressed in fetal (CT value = 29) vs adult liver (CT value = 33) and may be useful for differentiation between the two sources of this tissue.

This gene is also expressed at moderate levels in all central nervous system samples  
15 present on this panel. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3023 The NOV77 gene is ubiquitously expressed among the samples on this panel, with highest expression in an ovarian cancer cell line (CT=28.8). Overall, the expression of this gene shows good agreement with panel 1.4. A higher level of  
20 expression is observed in prostate, brain, melanoma, colon, lung, pancreatic, breast and ovarian cancer cell lines than the normal prostate, brain, colon, lung, pancreas, breast and ovary. Thus, expression of this gene could be used as a diagnostic marker of cancer in these tissues. Furthermore, inhibition of the activity of this gene product using small molecule drugs may be effective in the treatment of cancer in these tissues.

25 Among tissues with metabolic function, expression of this gene is widespread, as in the previous panel. Please see Panel 1.4 for discussion of utility of this gene in metabolic disease.

This gene represents a dual specificity phosphatase that is also expressed at low to moderate levels across the CNS. Dual-specificity phosphatases comprise a family of MAP kinase regulating enzymes, members of which are upregulated in brains subjected to insults  
30 such as ischemia and seizure activity. MAP kinases are known to regulate neurotrophic and neurotoxic pathways. Consequently, agents that modulate the activity of this gene may have utility in attenuating the apoptotic and neurodegenerative processes following brain insults.

#### References:

Wiessner C. The dual specificity phosphatase PAC-1 is transcriptionally induced in the rat brain following transient forebrain ischemia. *Brain Res Mol Brain Res* 1995 Feb;28(2):353-6

PAC-1 mRNA has previously been found only in activated T-cells in vitro and in vivo. The gene encodes a dual specificity protein phosphatase that regulates MAP kinase activity. Here, I describe that PAC-1 mRNA is induced also in neurons in the rat brain following 30 min of forebrain ischemia. At 6, 12 and 24 h after ischemia, PAC-1 mRNA was found most prominently in hippocampal cells which are resistant to 30 min of forebrain ischemia, but not in the selectively vulnerable CA1 sector. At later time points and in control animals no PAC-1 mRNA could be detected in any brain region. The protein-tyrosine/threonine phosphatase PAC-1, therefore, may be involved in adaptational responses of hippocampal cells resistant to ischemic injury.

Boschert U, Muda M, Camps M, Dickinson R, Arkinstall S. Induction of the dual specificity phosphatase PAC1 in rat brain following seizure activity. *Neuroreport* 1997 Sep 29;8(14):3077-80

Recurrent seizure activity leads to delayed neuronal death as well as to inflammatory responses involving microglia in hippocampal subfields CA1, CA3 and CA4. Since mitogen activated protein (MAP) kinases control neuronal apoptosis and trigger generation of inflammatory cytokines, their activation state could determine seizure-related brain damage. PAC1 is a dual specificity protein phosphatase inactivating MAP kinases which we have found to be undetectable in normal brain. Despite this, kainic acid-induced seizure activity lead to rapid (approximately 3 h) but transient appearance of PAC1 mRNA in granule cells of the dentate gyrus as well as in pyramidal CA1 neurons. This pattern changed with time and after 2-3 days PAC1 was induced in dying CA1 and CA3 neurons. At this time PAC1 mRNA was also expressed in white matter microglia as well as in microglia invading the damaged hippocampus. PAC1 may play an important role controlling MAP kinase involvement in both neuronal death and neuro-inflammation following excitotoxic damage.

**Panel 4D Summary:** Ag3023/Ag3373 The NOV77 gene is expressed at high to moderate levels in a wide range of cell types and tissues of significance in the immune response in health and disease. Highest expression of this gene is seen in ionomycin treated Ramos B cells (CT=26.83). Therefore, targeting of this gene product with a small molecule drug or antibody therapeutic may modulate the functions of cells of the immune system as well as resident tissue cells and lead to improvement of the symptoms of patients suffering

from autoimmune and inflammatory diseases such as asthma, allergies, inflammatory bowel disease, lupus erythematosus, and arthritis, including osteoarthritis and rheumatoid arthritis.

#### NOV78

- 5 Expression of gene NOV78 was assessed using the primer-probe set Ag3025, described in Table BSA. Results of the RTQ-PCR runs are shown in Tables BSB, BSC and BSD.

CNS\_neurodegeneration\_v1.0 Summary: Ag3025 This panel does not show differential expression of the NOV78 gene in Alzheimer's disease. However, this expression

profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3025 Highest expression of the NOV78 gene is seen in a lung cancer cell line (CT=30.5). Higher levels of expression are observed in prostate, lung, breast and ovarian cancer cell lines when compared with the normal prostate, lung, breast and ovary. Thus, expression of this gene may be used as a diagnostic marker of cancer in these tissues. Furthermore, inhibition of the activity of this gene product using small molecule drugs may be effective in the treatment of cancer in these tissues.

Among tissues with metabolic function, this gene has a low level of expression in pancreas, thyroid, pituitary, heart, and adipose. Therefore, this gene product may be a small molecule target for the treatment of metabolic and endocrine diseases, including obesity and Types 1 and 2 diabetes.

This gene represents a dual specificity phosphatase that is also expressed at low to moderate levels across the CNS. Dual-specificity phosphatases comprise a family of MAP kinase regulating enzymes that are upregulated in brains subjected to insults such as ischemia and seizure activity. MAP kinases are known to regulate neurotrophic and neurotoxic pathways. Consequently, agents that modulate the activity of this gene may have utility in attenuating the apoptotic and neurodegenerative processes following brain insults.

#### References:

Wiessner C. The dual specificity phosphatase PAC-1 is transcriptionally induced in the rat brain following transient forebrain ischemia. *Brain Res Mol Brain Res* 1995 Feb;28(2):353-6

PAC-1 mRNA has previously been found only in activated T-cells in vitro and in vivo. The gene encodes a dual specificity protein phosphatase that regulates MAP kinase activity. Here, I describe that PAC-1 mRNA is induced also in neurons in the rat brain following 30 min of forebrain ischemia. At 6, 12 and 24 h after ischemia, PAC-1 mRNA was found most prominently in hippocampal cells which are resistant to 30 min of forebrain ischemia, but not in the selectively vulnerable CA1 sector. At later time points and in control animals no PAC-1 mRNA could be detected in any brain region. The protein-tyrosine/threonine phosphatase PAC-1, therefore, may be involved in adaptational responses of hippocampal cells resistant to ischemic injury.

Boschert U, Muda M, Camps M, Dickinson R, Arkinstall S. Induction of the dual specificity phosphatase PAC1 in rat brain following seizure activity. *Neuroreport* 1997 Sep 29;8(14):3077-80

Recurrent seizure activity leads to delayed neuronal death as well as to inflammatory responses involving microglia in hippocampal subfields CA1, CA3 and CA4. Since mitogen activated protein (MAP) kinases control neuronal apoptosis and trigger generation of inflammatory cytokines, their activation state could determine seizure-related brain damage.

5 PAC1 is a dual specificity protein phosphatase inactivating MAP kinases which we have found to be undetectable in normal brain. Despite this, kainic acid-induced seizure activity lead to rapid (approximately 3 h) but transient appearance of PAC1 mRNA in granule cells of the dentate gyrus as well as in pyramidal CA1 neurons. This pattern changed with time and after 2-3 days PAC1 was induced in dying CA1 and CA3 neurons. At this time PAC1 mRNA  
10 was also expressed in white matter microglia as well as in microglia invading the damaged hippocampus. PAC1 may play an important role controlling MAP kinase involvement in both neuronal death and neuro-inflammation following excitotoxic damage.

**Panel 4D Summary:** Ag3025 The NOV78 gene is expressed at moderate to low levels in a wide range of cell types of significance Highest expression is detected in IL-9 treated  
15 NCI-H292 mucoepidermoid cells (CT=31.81) with lower expression levels in non-treated NCI-H292 cells. Expression is also seen in (i) LAK cells stimulated with IL-2, IL-2 +IL-12, IL-2 + IL-18, and IL-2 + IFNgamma (ii) stimulated and non-stimulated Ramos B cells and polkweed mitogen stimulated B lymphocytes, (iii) starved and IL-1 treated HUVECs, (iv) TNF alpha+IL-1 beta treated and non treated lung microvascular endothelial cells and resting  
20 coronary artery smooth muscle cells (v) treated Ku-812 basophils (vi) IFN gamma treated lung fibroblasts, and (vii) normal tissues represented by colon, lung, thymus and kidney. Based on this pattern of expression, this gene product may be involved in both disease and homeostatic processes for these and other cell types and tissues. Therefore, modulation of this gene product with a functional therapeutic may lead to the alteration of functions associated with these cell  
25 and tissue types and improvement of the symptoms of patients suffering from autoimmune and inflammatory diseases such as COPD, emphysema, asthma, allergies, inflammatory bowel disease, lupus erythematosus, psoriasis, rheumatoid arthritis, and osteoarthritis.

#### NOV79: Dual Specificity Phosphatase

Expression of gene NOV79 was assessed using the primer-probe set Ag3039,  
30 described in Table BTA. Results of the RTQ-PCR runs are shown in Tables BTB, BTC and BTD.

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3039 No differential expression of the NOV79 gene is detected between the postmortem brains of Alzheimer's diseased patients and those of non-demented controls. However, this panel confirms the expression of this gene in the CNS. Please see panel 1.3D for a discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3039 Highest expression of the NOV79 gene is seen in the testis (CT=29). In addition, expression of this gene is extremely low in renal and brain cancer cell lines but is expressed in the normal brain and kidney tissues on this sample. Therefore, this gene may be used as a diagnostic marker for brain and kidney cancer and prostate tissue. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of brain and renal cancers.

In addition, this gene is expressed at low levels in metabolic tissues including pancreas, adrenal, thyroid, pituitary, adult and fetal heart, and adipose. This novel protein phosphatase may be a small molecule target for the treatment of metabolic and endocrine disease, including obesity and Types 1 and 2 diabetes. This gene is also differentially expressed in fetal (CT values = 32-33) vs adult skeletal muscle (CT values = 35-40) and may be useful for the differentiation of adult and fetal skeletal muscle.

This gene represents a dual specificity phosphatase that is also expressed at low to moderate levels across the CNS. Dual-specificity phosphatases comprise a family of MAP kinase regulating enzymes that are upregulated in brains subjected to insults such as ischemia and seizure activity. MAP kinases are known to regulate neurotrophic and neurotoxic pathways. Consequently, agents that modulate the activity of this gene may have utility in attenuating the apoptotic and neurodegenerative processes following brain insults.

#### References:

Wiessner C. The dual specificity phosphatase PAC-1 is transcriptionally induced in the rat brain following transient forebrain ischemia. *Brain Res Mol Brain Res* 1995 Feb;28(2):353-6

PAC-1 mRNA has previously been found only in activated T-cells in vitro and in vivo. The gene encodes a dual specificity protein phosphatase that regulates MAP kinase activity. Here, I describe that PAC-1 mRNA is induced also in neurons in the rat brain following 30 min of forebrain ischemia. At 6, 12 and 24 h after ischemia, PAC-1 mRNA was found most prominently in hippocampal cells which are resistant to 30 min of forebrain ischemia, but not in the selectively vulnerable CA1 sector. At later time points and in control animals no PAC-1 mRNA could be detected in any brain region. The protein-tyrosine/threonine phosphatase PAC-1, therefore, may be involved in adaptational responses of hippocampal cells resistant to ischemic injury.

Boschert U, Muda M, Camps M, Dickinson R, Arkinstall S. Induction of the dual specificity phosphatase PAC1 in rat brain following seizure activity. *Neuroreport* 1997 Sep 29;8(14):3077-80

Recurrent seizure activity leads to delayed neuronal death as well as to inflammatory responses involving microglia in hippocampal subfields CA1, CA3 and CA4. Since mitogen activated protein (MAP) kinases control neuronal apoptosis and trigger generation of inflammatory cytokines, their activation state could determine seizure-related brain damage. PAC1 is a dual specificity protein phosphatase inactivating MAP kinases which we have found to be undetectable in normal brain. Despite this, kainic acid-induced seizure activity

lead to rapid (approximately 3 h) but transient appearance of PAC1 mRNA in granule cells of the dentate gyrus as well as in pyramidal CA1 neurons. This pattern changed with time and after 2-3 days PAC1 was induced in dying CA1 and CA3 neurons. At this time PAC1 mRNA was also expressed in white matter microglia as well as in microglia invading the damaged hippocampus. PAC1 may play an important role controlling MAP kinase involvement in both neuronal death and neuro-inflammation following excitotoxic damage.

**Panel 4D Summary:** Ag3039 Expression of the NOV79 gene is highest and almost exclusive to the thymus (CTs=29-30). Expression of this gene could be used to distinguish thymus from the other samples on this panel. The putative dual-specificity phosphatase encoded by this gene may play an important role in T cell development. Small molecule therapeutics designed against the protein encoded by this gene could therefore be utilized to modulate immune function (T cell development) and be important for organ transplant, AIDS treatment or post chemotherapy immune reconstitution.

#### NOV80

Expression of gene NOV80 was assessed using the primer-probe set Ag3044, described in Table BUA. Results of the RTQ-PCR runs are shown in Tables BUB and BUC.

**Panel 1.3D Summary:** Ag3044 Results from one experiment with the NOV80 gene are not included. The amp plot indicates that there were experimental difficulties with this run (data not shown).

- 5           **Panel 4D Summary:** Ag3044 The NOV80 gene is expressed at low levels in a wide range of cell types of significance in the immune response in health and disease. These cells include: (i) resting LAK and LAK cells stimulated with IL-2+IL-12, IL-2 + IL-18, and IL-2 + IFNgamma (ii) activated primary and secondary Th2 cells, resting primary Th1, Th2 and Tr1 cells, and activated CD8 and secondary CD8 lymphocytes, (iii) IL-1 beta treated HUVECs,
- 10 (iv) polkweed mitogen stimulated and CD40L + IL-4 stimulated B lymphocytes, (v) treated and non-treated Ku-812 basophils and non-treated dendritic cells, (vi) treated and non-treated peripheral blood mononuclear cells and resting macrophages (vii) treated and non-treated NCI-H292 mucoepidermoid, (viii) treated and non-treated lung fibroblasts, (viii) treated and non-treated astrocytes (ix) resting coronary artery SMCs, (x) resting and TNFalpha treated
- 15 CCD1070 dermal fibroblasts and IL-4 treated dermal fibroblasts (xi) IBD Crohn's diseases tissue and normal tissues represented by colon, lung, thymus and kidney with the highest expression being detected in thymus tissue (CT=29.81). This expression profile suggests that this gene product may be involved in both disease and homeostatic processes in these and other cell types and tissues. Therefore, modulation of this gene product with a functional
- 20 therapeutic may lead to the alteration of functions associated with these cell and tissue types and lead to improvement of the symptoms of patients suffering from autoimmune and inflammatory diseases such as COPD, emphysema, asthma, allergies, inflammatory bowel disease, lupus erythematosus, psoriasis, rheumatoid arthritis, and osteoarthritis.

**NOV81a and NOV81b**

Expression of gene NOV81a and the full length clone, NOV81b, was assessed using the primer-probe set Ag2906, described in Table BVA. Results of the RTQ-PCR runs are shown in Tables BVB, BVC and BVD.

Table BVA. Probe Name Ag2906

| Primers | Sequences                               | Length | Start Position | SEQ ID NO: |

**Panel 1.3D Summary:** Ag2906 The NOV81a gene has a low level of expression in adipose and may be a small molecule target for the treatment of obesity and obesity-related diseases, including Type 2 diabetes. In addition, this gene product appears to be differentially

expressed in fetal (CT value = 31) vs adult heart (CT value = 34) and may be useful for the differentiation between the two tissue types.

Overall, there appears to be higher expression of this gene in the normal tissues compared to the cell lines. Thus, this difference in expression might be of use as a diagnostic marker of cancer.

**Panel 2D Summary:** Ag2906 The NOV81a gene is expressed at low levels in this panel. A higher level of expression is observed in gastric, bladder, thyroid, breast and ovarian cancer samples when compared to expression in the normal adjacent gastric, bladder, thyroid, breast and ovary tissues. Thus, this gene could potentially be used as a diagnostic marker of cancer in these tissues. Furthermore, inhibition of the activity of this gene product using small molecule drugs may be useful for the treatment of cancer in these tissues.

**Panel 4D Summary:** Ag2906 Expression of the NOV81a is widespread in this panel, with highest expression in B lymphocytes treated with CD40L and IL-4 (CT=29.8). Significant expression is also seen in treated eosinophils, resting macrophages and monocytes, and normal colon and lung. Based on this pattern of expression, this gene product may be involved in both disease and homeostatic processes for these and other cell types and tissues. Therefore, modulation of this gene product with a functional therapeutic may lead to the alteration of functions associated with these cell and tissue types and improvement of the symptoms of patients suffering from autoimmune and inflammatory diseases such as COPD, emphysema, asthma, allergies, inflammatory bowel disease, lupus erythematosus, psoriasis, rheumatoid arthritis, and osteoarthritis. In addition, the higher levels of expression in colon (CT=30) when compared to colon from patients with inflammatory bowel diseases (IBD)(CTs=35-40) suggests that expression of this gene could be used to differentiate between normal and inflamed colon. Therapeutic modulation of the expression or function of this gene may be effective in the treatment of IBD.

## NOV82

Expression of gene NOV82 was assessed using the primer-probe sets Ag3198 and Ag3063, described in Tables BWA and BWB.

**Table BWA. Probe Name Ag3198**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|
| Forward | 5'-cgtgggcaccagacagttaatt-3'               | 22     | 179            | 1321       |
| Probe   | TET-5'-cctaccagacaccattgtgtccaagg-3'-TAMRA | 26     | 212            | 1322       |
| Reverse | 5'-gtcttttcctttgtgcttgtgaa-3'              | 22     | 246            | 1323       |

**Table BWB. Probe Name Ag3063**

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |
|---------|------------------------------------------------|--------|----------------|------------|
| Forward | 5'-cgtgggcaccagacagttaatt-3'                   | 22     | 179            | 1324       |
| Probe   | TET-5'-cctaccagacaccattgtgtccaagg-3'-<br>TAMRA | 26     | 212            | 1325       |
| Reverse | 5'-gtcttttcctttgtgcttgtgaa-3'                  | 22     | 246            | 1326       |

5 **CNS\_neurodegeneration\_v1.0 Summary:** Ag3198 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown). The amp plot indicates that there is a high probability of a potential probe or chemistry failure.

**Panel 1.3D Summary:** Ag3063 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown). The amp plot indicates that there is a high probability of a potential probe or chemistry failure.

10 **Panel 4D Summary:** Ag3198 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown). The amp plot indicates that there is a high probability of a potential probe or chemistry failure.

**NOV83**

15 Expression of gene NOV83 was assessed using the primer-probe sets Ag3046 and Ag4125, described in Tables BXA and BXB. Results of the RTQ-PCR runs are shown in Tables BXC and BXD.

**Table BXA. Probe Name Ag3046**

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3046 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

Ag4125 Results from one experiment with this gene are not included. The amp plot indicates that there were experimental difficulties with this run (data not shown).

**General\_screening\_panel\_v1.4 Summary:** Ag4125 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 1.3D Summary:** Ag3046 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 2D Summary:** Ag3046 Significant expression of this gene is seen exclusively in a breast cancer sample (CT = 25.2). Therefore, expression of this gene may be used to distinguish breast cancers from the other samples on this panel. Furthermore, therapeutic modulation of the activity of the GPCR encoded by this gene may be beneficial in the treatment of breast cancer.

**Panel 3D Summary:** Ag3046 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4.1D Summary:** Ag4125 This gene is only expressed at detectable levels in the kidney (CT = 32.6). The putative GPCR encoded for by this gene could allow cells within the kidney to respond to specific microenvironmental signals (For example, ref. 1). Therefore, antibody or small molecule therapies designed with the protein encoded for by this gene could modulate kidney function and be important in the treatment of inflammatory or autoimmune diseases that affect the kidney, including lupus and glomerulonephritis.

#### References:

1. Mark M.D., Wittemann S., Herlitz S. (2000) G protein modulation of recombinant P/Q-type calcium channels by regulators of G protein signalling proteins. *J. Physiol.* 528 Pt 1: 65-77.

1. Fast synaptic transmission is triggered by the activation of presynaptic Ca<sup>2+</sup> channels which can be inhibited by Gbetagamma subunits via G protein-coupled receptors (GPCR). Regulators of G protein signalling (RGS) proteins are GTPase-accelerating proteins (GAPs), which are responsible for >100-fold increases in the GTPase activity of G proteins and might be involved in the regulation of presynaptic Ca<sup>2+</sup> channels. In this study we investigated the effects of RGS2 on G protein modulation of recombinant P/Q-type channels expressed in a human embryonic kidney (HEK293) cell line using whole-cell recordings. 2. RGS2 markedly accelerates transmitter-mediated inhibition and recovery from inhibition of Ba<sup>2+</sup> currents (IBa) through P/Q-type channels heterologously expressed with the muscarinic acetylcholine receptor M2 (mAChR M2). 3. Both RGS2 and RGS4 modulate the prepulse facilitation properties of P/Q-type Ca<sup>2+</sup> channels. G protein reinhibition is accelerated, while release from inhibition is slowed. These kinetics depend on the availability of G protein alpha and betagamma subunits which is altered by RGS proteins. 4. RGS proteins unmask the Ca<sup>2+</sup> channel beta subunit modulation of Ca<sup>2+</sup> channel G protein inhibition. In the presence of RGS2, P/Q-type channels containing the beta2a and beta3 subunits reveal significantly altered

kinetics of G protein modulation and increased facilitation compared to Ca<sup>2+</sup> channels coexpressed with the beta1b or beta4 subunit.

5 **CNS\_neurodegeneration\_v1.0 Summary:** Ag3057 The NOV85 gene is found to be slightly but significantly ( $p=0.016$ ) upregulated in the Alzheimer's disease (AD) temporal cortex. The temporal cortex is the region of the brain where neurons degenerate in the mid stages of AD. This increase in expression is not apparent in the occipital cortex, which does not experience neurodegeneration in AD. Since the upregulation of this gene appears to be neurodegeneration-specific both within an individual brain and between brains, this gene is an excellent small molecule target. Therefore, treatment with an antagonist may decrease the pathology seen in Alzheimer's disease.

10 **Panel 1.3D Summary:** Ag3057 Highest expression of the NOV85 gene is seen in the CNS. Please see CNS\_Neurodegeneration for discussion of utility of this gene in the central nervous system.

Among tissues with metabolic function, this gene has low levels of expression in pancreas, adrenal, thyroid, pituitary, skeletal muscle and adipose. Therefore, modulation of

this gene product may be a treatment for metabolic and endocrine diseases, including obesity and Types 1 and 2 diabetes.

In addition, this gene is expressed at low levels in the cancer cell lines in this panel.

This difference in expression is particularly prominent in the CNS cancer cell lines when

5 compared to the normal brain tissues. Thus, this gene could potentially be used as a diagnostic marker in CNS cancers.

**Panel 2D Summary:** Ag3057 The NOV85 gene is expressed at moderate to low levels in this panel. A higher level of expression is observed in lung, kidney, uterine, gastric and ovarian cancer when compared to the normal adjacent lung, kidney, uterine, gastric and  
10 ovarian tissues in this panel. Thus, this gene could be used as a diagnostic marker of cancer in these tissues. Furthermore, inhibition of the activity of this gene product using small molecule drugs may be useful for the treatment of cancer in these tissues

**Panel 4D Summary:** Ag3057 The amp plot indicates that there is a high probability of experimental failure. (Data not shown.)

15 **Panel CNS\_1 Summary:** Ag3057 These results confirm expression of the NOV85 gene in the brain. Please see CNS\_Neurodegeneration for discussion of utility of this gene in the central nervous system.

#### NOV86: GTPASE-ACTIVATING PROTEIN

20 Expression of gene NOV86 was assessed using the primer-probe set Ag3058, described in Table CAA. Results of the RTQ-PCR runs are shown in Tables CAB, CAC and CAD.

**Table CAA. Probe Name Ag3058**

| Primers | Sequences                                     | Length | Start Position | SEQ ID NO: |

**Panel 1.3D Summary:** Ag3058 Highest expression of the NOV86 gene, a GTPase-activating protein homolog, is seen in the lymph node (CT=27.8). Among tissues with metabolic function, this gene has low levels of expression in pancreas, adrenal, thyroid, pituitary, heart, skeletal muscle, liver and adipose. Rab GTPases are integral to vesicular transport in the secretory and endocytic pathways. Therefore, therapeutic modulation of this gene product may be a treatment for metabolic and endocrine diseases, including obesity and Types 1 and 2 diabetes.

This GTPase activating enzyme like molecule is also expressed at low levels in the CNS. Thus, it may be useful in treating diseases of the nervous system, stroke or CNS trauma.

In addition, this gene is expressed at low levels in the cancer cell lines in this panel. Therefore, modulation of expression of this gene may be useful in treating cancer.

**Panel 2D Summary:** Ag3058 The NOV86 gene is expressed at low levels in this panel. There is higher expression in kidney, breast, liver and bladder cancer samples compared to the adjacent normal tissue. Conversely, there is lower expression in lung cancer samples compared to the adjacent normal tissue. Thus, the expression of this gene could be used as a diagnostic marker for kidney, breast, liver, bladder and lung cancers. Furthermore, modulation of expression of this gene may also be used for therapy of these cancers.

**Panel 4D Summary:** Ag3058 The NOV86 gene is expressed at high to moderate levels in a wide range of cell types of significance in the immune response and tissue response

- in health and disease, with the highest expression being detected in TNF alpha plus IL-1 beta treated small airway epithelial cells (CT=28.03). Therefore, targeting of this gene product with a small molecule drug or antibody therapeutic may modulate the functions of cells of the immune system as well as resident tissue cells and lead to improvement of the symptoms of patients suffering from autoimmune and inflammatory diseases such as COPD, emphysema, asthma, allergies, inflammatory bowel disease, lupus erythematosus, and arthritis, including osteoarthritis and rheumatoid arthritis.

#### NOV87a and NOV87b

- Expression of gene NOV87a and full length clone NOV87b was assessed using the primer-probe set Ag3040, described in Table CBA.

**Table CBA. Probe Name Ag3040**

| Primers | Sequences                                 | Length | Start Position | SEQ ID NO: |
|---------|-------------------------------------------|--------|----------------|------------|
| Forward | 5'-gagccctgaagctcttcttttc-3'              | 21     | 617            | 1342       |
| Probe   | TET-5'-cttctcgcacttccgccagttcatt-3'-TAMRA | 25     | 663            | 1343       |
| Reverse | 5'-cctggctcctgctcactgat-3'                | 19     | 694            | 1344       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3040 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

- Panel 1.3D Summary:** Ag3040 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4D Summary:** Ag3040 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

#### NOV88

- Expression of gene NOV88 was assessed using the primer-probe set Ag2923, described in Table CCA.

**Table CCA. Probe Name Ag2923**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |
|---------|--------------------------------------------|--------|----------------|------------|
| Forward | 5'-agtcaacagatttgccacat-3'                 | 21     | 45             | 1345       |
| Probe   | TET-5'-tcaccagggctgcttttaactctggt-3'-TAMRA | 26     | 77             | 1346       |
| Reverse | 5'-cagtgaaggggtcactgatg-3'                 | 20     | 120            | 1347       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag2923 Expression of this gene is low/undetectable (CTs > 34.5) across all of the samples on this panel (data not shown).

**Panel 1.3D Summary:** Ag2923 Expression of this gene is low/undetectable (CTs > 34.5) across all of the samples on this panel (data not shown).

5 **Panel 2D Summary:** Ag2923 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4D Summary:** Ag2923 Expression of this gene is low/undetectable (CTs > 34.5) across all of the samples on this panel (data not shown).

## NOV89

10 Expression of gene NOV89 was assessed using the primer-probe set Ag2924, described in Table CDA.

**Table CDA. Probe Name Ag2924**

| Primers | Sequences                                    | Length | Start Position | SEQ ID NO: |
|---------|----------------------------------------------|--------|----------------|------------|
| Forward | 5'-gaacgggaagcttggtatcaat-3'                 | 22     | 231            | 1348       |
| Probe   | TET-5'-agatctcaccaaatcaaaggggca-3'-<br>TAMRA | 26     | 282            | 1349       |
| Reverse | 5'-atgatgtactcagtgccagcat-3'                 | 22     | 308            | 1350       |

15 **CNS\_neurodegeneration\_v1.0 Summary:** Ag2924 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 1.3D Summary:** Ag2924 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**Panel 4D Summary:** Ag2924 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

20 **Panel 5 Islet Summary:** Ag2924 Run 242285280 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown). Run 243564308 The amp plot indicates that there were experimental difficulties with this run.

## NOV90

25 Expression of gene NOV90 was assessed using the primer-probe set Ag3045, described in Table CEA. Results of the RTQ-PCR runs are shown in Tables CEB, CEC, CED, CEE, CEF and CEG.

Table CEA. Probe Name Ag3045

| Primers | Sequences                                      | Length | Start Position | SEQ ID NO: |
|---------|------------------------------------------------|--------|----------------|------------|

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3045 The NOV90 gene is not differentially expressed in the postmortem brains of Alzheimer's diseased patients when compared to non-demented control. However, this panel does confirm the expression of this gene in the CNS of an independent sample of individuals. See panel 1 for a discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3045 Expression of the NOV90 gene shows a brain-preferential expression profile, and is expressed at moderate levels in all regions examined. Thus, this gene may be of utility as a small molecule target in neurologic disease.

In addition, significant expression is seen in a cluster of brain cancer cell lines. Thus, expression of this gene could be used to differentiate between this sample and other samples on this panel and as a marker to detect the presence of brain cancer. Furthermore, therapeutic

modulation of the expression or function of this gene may be effective in the treatment of brain cancer.

**Panel 2D Summary:** Ag3045 The NOV90 gene is expressed at low levels in this panel. There is higher expression in gastric, breast, uterus and lung cancers than the normal samples from these organs. Expression of this gene could therefore be used as a diagnostic marker for gastric, lung, breast and uterine cancers. Furthermore, modulation of the gene product using small molecule inhibitors could be used for the treatment of these cancers.

**Panel 3D Summary:** Ag3045 The NOV90 gene is expressed at a low level in most of the cancer cell lines on this panel. Modulation of the gene product using small molecule inhibitors could therefore be used for the treatment of cancer. Highest expression of this gene is seen in the cerebellum, confirming the results seen in Panel 1.3D.

**Panel 4D Summary:** Ag3045 The NOV90 gene, a serine/threonine-protein kinase homolog is expressed at moderate levels in pulmonary mucoepidermoid cells prepared under several conditions of cell activation: NCI-H292 none (CT=29.01), NCI-H292 IL-4 (CT=29.26), NCI-H292 IL-9 (CT=29.06), NCI-H292 IL-13 (CT=31.06), NCI-H292 IFN gamma (CT=31.14). Therefore, small molecule antagonists that block the function of the NOV90 gene product may be useful in several autoimmune and inflammatory diseases of the lung including, but not limited to, chronic obstructive pulmonary disease, asthma, and emphysema.

**Panel CNS\_1 Summary:** Ag3045 The expression in this panel confirms the presence of the NOV90 in the brain. Thus, this gene may be of utility as a small molecule target in neurologic disease.

## NOV91

Expression of gene NOV91 was assessed using the primer-probe set Ag3018, described in Table CFA. Results of the RTQ-PCR runs are shown in Tables CFB, CFC and CFD.

**Table CFA. Probe Name Ag3018**

| Primers | Sequences                               | Length | Start Position | SEQ ID NO: |
|---------|-----------------------------------------|--------|----------------|------------|
| Forward | 5'-ctgcagggttgagaaatg-3'                | 19     | 71             | 1354       |
| Probe   | TET-5'-ccatcctgggcaaaccgaaggat-3'-TAMRA | 23     | 107            | 1355       |
| Reverse | 5'-ctacacccatcatgttcacatg-3'            | 22     | 130            | 1356       |

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3018 This panel does not show differential expression of the NOV91 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag3018 The NOV91 gene is expressed in the brain at low levels. D-dopachrome tautomerase has been implicated in the production of neuromelanin from the toxic quinone products of dopamine, and this pathway has been implicated in the death of dopaminergic neurons in Parkinson's disease. Thus, this gene may represent an excellent small molecule target for the treatment or prevention of Parkinson's disease.

In addition, significant expression is seen in a cluster of lung, brain, and colon cancer cell lines. Thus, expression of this gene could be used to differentiate between the sample and other samples on this panel and as a marker to detect the presence of these cancers. Furthermore, therapeutic modulation of the expression or function of this gene may be effective in the treatment of lung, brain, and colon cancer.

Matsunaga J, Sinha D, Solano F, Santis C, Wistow G, Hearing V. Macrophage migration inhibitory factor (MIF)--its role in catecholamine metabolism. *Cell Mol Biol (Noisy-le-grand)* 1999 Nov;45(7):1035-40

Macrophage migration inhibitory factor (MIF) was originally identified several  
5 decades ago as a lymphokine-derived protein that inhibited monocyte migration. Recently, it  
has been reported that MIF has D-dopachrome tautomerase, phenylpyruvate tautomerase and  
thiol protein oxidoreductase activities, although the physiological significance of those  
activities is not yet clear. Here we show that MIF is able to catalyze the conversion of  
dopaminechrome and norepinephrinechrome, toxic quinone products of the neurotransmitters  
10 dopamine and norepinephrine, respectively, to indole derivatives that may serve as precursors  
to neuromelanin. Since MIF is highly expressed in human brain, these observations raise the  
possibility that MIF participates in a detoxification pathway for catecholamine products and  
could therefore have an important role for neural tissues. The potential role of MIF in the  
formation of neuromelanin from catecholamines is also an extremely interesting possibility.

15 Drukarch B, van Muiswinkel FL. Neuroprotection for Parkinson's disease: a new  
approach for a new millennium. *Expert Opin Investig Drugs* 2001 Oct;10(10):1855-68

Parkinson's disease (PD) is the only neurodegenerative disorder in which  
pharmacological intervention has resulted in a marked decrease in morbidity and a significant  
delay in mortality. However, the medium to long-term efficacy of this pharmacotherapy,  
20 mainly consisting of dopaminomimetics like L -dopa and dopamine receptor agonists, suffers  
greatly from the unrelenting progression of the disease process underlying PD, i.e., the  
degeneration of neuromelanin-containing, dopaminergic neurones in the substantia nigra.  
Efforts concentrated on understanding the mechanisms of dopaminergic cell death in  
Parkinson's disease have led to identification of a large variety of pathogenetic factors,  
25 including excessive release of oxygen free radicals during enzymatic dopamine breakdown,  
impairment of mitochondrial function, production of inflammatory mediators, loss of trophic  
support, and apoptosis. Therapeutic approaches aimed at correcting these abnormalities are  
currently being evaluated on their efficacy as neuroprotectants for PD. Here, we focus on the  
process of dopamine auto-oxidation, the chain of reactions leading to the formation of  
30 neuromelanin, as an often overlooked, yet obvious pathogenetic factor. In particular, we  
discuss the option of drug-mediated stimulation of endogenous mechanisms responsible for  
the detoxification of dopamine auto-oxidation products as a novel means of neuroprotection in  
Parkinson's disease.

**Panel 4D Summary:** Ag3018 The NOV91 gene, a D-dopachrome tautomerase homolog, is widely expressed in this panel, with highest expression in Ramos (B cells) activated by treatment with ionomycin (CT=31.28). Therefore, small molecule antagonists that block the function of the NOV91 gene product may be useful in several autoimmune and inflammatory diseases in which activated B cells can play major roles as sources of autoantibody-producing cells and also as powerful antigen-presenting cells, including, but not limited to, Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

**Panel 5 Islet Summary:** Ag3018 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

## NOV92

Expression of gene NOV92 was assessed using the primer-probe set Ag3048, described in Table CGA. Results of the RTQ-PCR runs are shown in Tables CGB, CGC, CGD and CGE.

**Table CGA. Probe Name Ag3048**

**Panel 1.3D Summary:** Ag3048 The expression of the NOV92 gene appears to be highest in a sample derived from a brain cancer cell line (SF-539) (CT=29.4). In addition, there is substantial expression associated with samples derived from another brain cancer cell line, two melanoma cell lines and a lung cancer cell line. Thus, the expression of this gene could be used to distinguish SF-539 cells from other samples in the panel. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, protein therapeutics or antibodies might be of benefit in treatment of brain or lung cancer or melanoma.

This gene, a leucine-rich repeat homolog, is expressed at low levels in the CNS. The leucine-rich repeat region proteins have been implicated in axonal guidance. Therefore, this gene may be of therapeutic utility in the treatment of any CNS disorder involving neuronal loss, specifically by guiding/enhancing compensatory synaptogenesis and fiber outgrowth, including such clinical conditions as Alzheimer's, Parkinson's, or Huntington's diseases, stroke, head and spinal cord trauma, vascular dementia or spinocerebellar ataxia.

**Panel 2D Summary:** Ag3048 The expression of the NOV92 gene appears to be highest in a sample derived from an ovarian cancer (CT=29). In addition, there appears to be substantial expression associated with lung cancer, prostate cancer and colon cancer samples. Of note is the differential expression in the lung, colon and prostate cancer samples compared to their respective normal adjacent tissue. Thus, the expression of this gene could be used to distinguish this ovarian cancer sample from other samples in the panel. In addition, the expression of this gene could be used to distinguish colon, prostate or lung cancer samples from their normal adjacent tissue. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, protein therapeutics or antibodies might be beneficial in the treatment of ovarian, lung, prostate or colon cancer.

**Panel 3D Summary:** Ag3048 The expression of the NOV92 gene appears to be highest in a sample derived from a brain cancer cell line (SNB-78) (CT=30.2). In addition, there appears to be substantial expression associated with other brain cancer cell line samples and a lung cancer cell line sample. Thus, the expression of this gene could be used to distinguish SNB-78 cells from other samples in the panel. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, protein therapeutics or antibodies might be beneficial in the treatment of brain or lung cancer.

**Panel 4D Summary:** Ag3048 The NOV92 gene, a secreted leucine-rich repeat (LRR) protein, is expressed selectively at moderate levels (CT range 29-31) in several resting and cytokine-activated epithelial and connective tissue cells of lung and skin. Therefore, the NOV92 gene product may be useful as a therapeutic protein as well as a target for therapeutic antibodies and small molecules, each of which may prove beneficial in the reduction or elimination of the symptoms in patients with chronic obstructive pulmonary disease, asthma, emphysema, or psoriasis.

#### NOV93: IMP DEHYDROGENASE 1

Expression of gene NOV93 was assessed using the primer-probe sets Ag4520 and Ag2904, described in Tables CHA and CHB. Results of the RTQ-PCR runs are shown in Tables CHC, CHD, CHE, CHF, CHG, CHH and CHI.

**Table CHA. Probe Name Ag4520**

| Primers | Sequences                                | Length | Start Position | SEQ ID NO: |

5 **AI\_comprehensive panel\_v1.0 Summary:** Ag4520 The NOV93 gene is widely expressed among the samples on this panel, with highest expression in normal colon adjacent to diseased colon (CT=29). This widespread pattern of expression is consistent with expression in Panels 4D and 4.1D. Please see Panel 4.1D for discussion of utility of this gene in inflammation.

10 **CNS\_neurodegeneration\_v1.0 Summary:** Ag2904/Ag4520 The NOV93 gene, an IMP dehydrogenase homolog, shows a small but significant ( $p=0.02$ ) upregulation in the postmortem Alzheimer's brain when compared to nondemented controls. IMP dehydrogenase is involved in purine metabolism, and has been implicated as a drug target for suppressing the

immune response, inflammation, and cerebral edema. The observed increase in the expression of this gene is in concordance with the evidence for the role of neuroinflammation in Alzheimer's disease. Therefore, the inhibition of this molecule may be of therapeutic benefit in Alzheimer's disease, head or spinal cord trauma, stroke, cerebral edema, or viral infections of the CNS.

Hall IH, Wyrick SD. Cytotoxicity of [(5,6-dichloro-9a-n-propyl-2,3,9,9a-tetrahydro-3-oxo-1H fluoren-7-yl)oxy]acetic acid, an agent known to reduce brain edema. *Biomed Pharmacother* 1996;50(1):19-23

10 A known agent, [(5,6-dichloro-9a-n-propyl-2,3,9,9a-tetrahydro-3-oxo-1H fluoren-7-yl)oxy]acetic acid, which blocks brain edema, was also shown to be a potent cytotoxic agent in leukemia cells. The major site of action of the agents appears to be in the de novo purine synthetic pathway in L1210 leukemic cells. Both PRPP amido transferase and IMP dehydrogenase activities were suppressed by the agent. The inhibition of both regulatory enzymes of the pathway along with the reduction of dihydrofolate reductase activity would account for the observed suppression of DNA and RNA syntheses and subsequent cancer cell death.

Senda M, Natsumeda Y. Tissue-differential expression of two distinct genes for human IMP dehydrogenase (E.C.1.1.1.205). *Life Sci* 1994;54(24):1917-26

20 Human IMP dehydrogenase (E.C. 1.1.1.205) is recently regarded as a potent targeting-enzyme for immunosuppressive drugs. Tissue differential expressions of human type I and type II IMP dehydrogenase were investigated in sixteen human adult organs (heart, brain, placenta, lung, liver, skeletal muscle, kidney, pancreas, spleen, thymus, prostate, testis, ovary, small intestine, colon, peripheral blood leukocytes) and five human fetal organs (heart, brain, lung, liver, kidney) using Northern blot analysis. In all tissues examined in this study, the sizes of mRNAs of each isoform were identical, respectively. The 2.3 kb type II mRNA was shown predominantly, and the 3.5 kb type I mRNA level was lower than type II in most human tissues examined. In contrast, type I IMPDH gene expressed higher than type II in peripheral blood leukocytes, uniquely. We also demonstrated that both type I and type II IMPDH genes are widely distributed among various species by Southern blot analysis. Interestingly, type I IMPDH gene may have multiple gene families in primates. [dstone, 17-Jan-02]

30 **General\_screening\_panel\_v1.4 Summary:** Ag4250 Two experiments with the same probe and primer set produce results that are in excellent agreement, with highest expression of the NOV93 gene in a gastric cancer cell line and fetal lung tissue. In addition, there appears

to be substantial expression associated with breast cancer cell lines, lung cancer cell lines and renal cancer cell lines. Thus, the expression of this gene could be used to distinguish NCI-N87 and fetal lung tissue from the other samples in the panel. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, antibodies or protein therapeutics might be beneficial in the treatment of breast, lung or kidney cancer.

Among tissues with metabolic function, this gene has low-to-moderate levels of expression in adipose, liver, heart, skeletal muscle, adrenal, pituitary, thyroid and pancreas. Thus, this gene product may be a small molecule target for the treatment of metabolic and endocrine diseases, including obesity and Type 2 diabetes. This encodes a putative IMP dehydrogenase, which is involved in purine metabolism and has been implicated as a target for suppressing the immune response. Thus, this gene product may also be a treatment for Type 1 diabetes, in which insulin-secreting beta cells are destroyed by the autoimmune response against them. In addition, this gene appears to be differentially expressed in fetal (CT values = 30) vs adult liver (CT value = 33) and in fetal (CT values =27-28) vs. adult lung (CTs = 32-33), and may be useful for the differentiation between the two sources of these tissues.

This molecule is also expressed at moderate to low levels in all CNS regions examined. Please see panel CNS\_Neurodegeneration for a discussion of utility of this gene in the central nervous system.

**Panel 1.3D Summary:** Ag2904 Expression of the NOV93 gene is higher overall in normal tissues, with highest expression in fetal skeletal muscle. Furthermore, this gene is expressed at higher levels in fetal skeletal muscle (CT=29) when compared to expression in adult skeletal muscle (CT=32). Thus, expression of this gene could be used to differentiate between fetal skeletal muscle and other samples on this panel and between fetal and adult skeletal muscle.

Expression in the CNS is consistent with expression in previous panels. Please see CNS\_neurodegeneration for discussion of utility of this gene in the central nervous system.

Among tissues with metabolic function, this gene is expressed at moderate to low levels in adipose, adrenal gland, pancreas, thyroid, and adult and fetal skeletal muscle, heart and liver. This widespread expression among these tissues suggests that this gene product may be useful for the diagnosis and/or treatment of metabolic disease, including obesity and diabetes.

**Panel 2D Summary:** Ag2904 The expression of the NOV93 gene appears to be highest in a sample derived from normal lung tissue. In addition, there appears to be substantial expression in most of the samples in the panel. Of note is the expression associated

with normal lung tissue when compared to adjacent lung cancer tissue. Thus, the expression of this gene could be used to distinguish this sample of normal lung tissue from other samples in the panel. In addition, the expression of this gene could be used to distinguish normal lung tissue adjacent to cancer tissue. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, antibodies or protein therapeutics might be beneficial in the treatment of lung cancer.

**Panel 4D/4.1D Summary:** Ag2904/Ag4520 The NOV93 gene, a novel IMP dehydrogenase-like protein, is differentially expressed, as displayed in Panels 4.1D and 4D, in activated T cells, activated B cells, activated monocytes, activated macrophages, and activated dendritic cells. Small molecule antagonists of the previously characterized IMP dehydrogenase have been found to be useful in the treatment of several immunopathological states (See Allison and Eugui, 2001). Therefore, small molecule antagonists of the NOV93 gene product may reduce or eliminate the symptoms of autoimmune and inflammatory diseases, including Crohn's disease, ulcerative colitis, multiple sclerosis, chronic obstructive pulmonary disease, asthma, emphysema, rheumatoid arthritis, lupus erythematosus, or psoriasis.

Allison AC, Eugui EM. Mycophenolate mofetil and its mechanisms of action. *Immunopharmacology* 2000 May;47(2-3):85-118

Mycophenolate mofetil (MMF, CellCept(R)) is a prodrug of mycophenolic acid (MPA), an inhibitor of inosine monophosphate dehydrogenase (IMPDH). This is the rate-limiting enzyme in de novo synthesis of guanosine nucleotides. T- and B-lymphocytes are more dependent on this pathway than other cell types are. Moreover, MPA is a fivefold more potent inhibitor of the type II isoform of IMPDH, which is expressed in activated lymphocytes, than of the type I isoform of IMPDH, which is expressed in most cell types. MPA has therefore a more potent cytostatic effect on lymphocytes than on other cell types. This is the principal mechanism by which MPA exerts immunosuppressive effects. Three other mechanisms may also contribute to the efficacy of MPA in preventing allograft rejection and other applications. First, MPA can induce apoptosis of activated T-lymphocytes, which may eliminate clones of cells responding to antigenic stimulation. Second, by depleting guanosine nucleotides, MPA suppresses glycosylation and the expression of some adhesion molecules, thereby decreasing the recruitment of lymphocytes and monocytes into sites of inflammation and graft rejection. Third, by depleting guanosine nucleotides MPA also depletes tetrahydrobiopterin, a co-factor for the inducible form of nitric oxide synthase (iNOS). MPA therefore suppresses the production by iNOS of NO, and consequent tissue damage mediated

by peroxyxynitrite. CellCept(R) suppresses T-lymphocytic responses to allogeneic cells and other antigens. The drug also suppresses primary, but not secondary, antibody responses. The efficacy of regimes including CellCept(R) in preventing allograft rejection, and in the treatment of rejection, is now firmly established. CellCept(R) is also efficacious in several experimental animal models of chronic rejection, and it is hoped that the drug will have the same effect in humans.

#### NOV94

Expression of gene NOV94 was assessed using the primer-probe set Ag2905, described in Table CIA. Results of the RTQ-PCR runs are shown in Tables CIB, CIC and CID.

**Table CIA. Probe Name Ag2905**

**Panel 1.3D Summary: Ag2905** The expression of the NOV94 gene appears to be highest in a sample derived from normal testis tissue (CT=28.9). In addition, there is substantial expression associated with samples derived from colon cancer cell lines, lung cancer cell lines and breast cancer cell lines. Thus, the expression of this gene could be used to distinguish normal testis tissue from other samples in the panel. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, protein therapeutics or antibodies could be beneficial for the treatment of colon, lung or breast cancer.

In addition, this gene appears to be differentially expressed in fetal (CT value = 37) vs adult heart (CT value = 32), and may be useful for the differentiation between the two sources of heart tissue.

**Panel 2D Summary: Ag2905** The expression of the NOV94 gene appears to be highest in a sample derived from an ovarian cancer (CT=30.5). In addition, there appears to be substantial expression associated with breast cancers, lung cancers, gastric cancers, prostate cancers and colon cancers. Thus, the expression of this gene could be used to distinguish this ovarian cancer sample from others in the panel. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, protein therapeutics or antibodies might be beneficial in the treatment of ovarian, breast, lung, gastric, prostate or colon cancer.

**Panel 4D Summary: Ag2905** Low but significant expression of the NOV94 transcript is found predominantly in activated B cell lymphoma cell line (Ramos) and activated B cells (CTs=32-34). It is also found in HUVEC, keratinocytes, lung fibroblasts and the mucopidermoid cell line H292. Therefore, targeting of this gene product with a small molecule drug therapeutic may modulate the functions of B cells and lead to the improvement of symptoms in autoimmune diseases such as lupus erythematosus, rheumatoid arthritis, hyperglobulinemia and other B cell disorders.

## NOV95

Expression of gene NOV95 was assessed using the primer-probe set Ag3060, described in Table CJA. Results of the RTQ-PCR runs are shown in Tables CJB and CJC.

Table CJA. Probe Name Ag3060

| Primers | Sequences                                           | Length | Start Position | SEQ ID NO: |

**Panel 1.3D Summary:** Ag3060 Results from one experiment with this gene are not included. The amp plot indicates that there were experimental difficulties with this run (data not shown).

- 5 **Panel 4D Summary:** Ag3060 High expression of the NOV95 transcript (CT<sub>s</sub>= 26.3-26.9) is found in activated B cells and B cell lymphoma (Ramos). B cells generate antibody response and lead to activation of T cell mediated response as antigen presenting cells and are central to the function of the immune response. Therefore, targeting of this gene product with a small molecule drug therapeutic may modulate the functions of B cells and lead to the

improvement of symptoms of autoimmune diseases such as lupus erythematosus, rheumatoid arthritis, hyperglobulinemia and other B cell disorders.

In addition, moderate expression of this gene is also found in a wide range of cell types of significance in the immune response in health and diseases. This suggests the broader involvement of the protein encoded by this gene in many inflammatory and autoimmune diseases.

#### NOV96a, NOV96b, and NOV96c

Expression of gene NOV96a and full length clones NOV96b and NOV96c was assessed using the primer-probe set Ag4532, described in Table CKA. Results of the RTQ-PCR runs are shown in Table CKB.

**Table CKA. Probe Name Ag4532**

| Primers | Sequences                                  | Length | Start Position | SEQ ID NO: |

**General\_screening\_panel\_v1.4 Summary:** Ag4532 The expression of the NOV96a gene appears to be highest in a sample derived from a renal cancer cell line (ACHN)(CT=26.4). In addition, there is substantial expression associated with other renal cancer cell lines as well as gastric cancer cell lines, colon cancer cell lines, lung cancer cell lines, and breast cancer cell lines. Thus, the expression of this gene could be used to distinguish ACHN cells from other samples in this panel. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, protein therapeutics or antibodies might be of benefit in the treatment of kidney, gastric, colon, lung or breast cancer.

Among metabolic tissues, this gene has low-to-moderate levels of expression in adipose, liver, heart, skeletal muscle, adrenal, pituitary, thyroid, and pancreas. Thus, this gene product may be a small molecule target for the treatment of endocrine and metabolic diseases, including obesity and Types 1 and 2 diabetes. The direction of therapeutic modulation for this gene product would, of necessity, be tissue- or organ-specific. The consequences of altered lactate/monocarboxylate/ketone body transport would differ dramatically between tissues.

In addition, this gene, a monocarboxylate transporter homolog, is expressed at low to moderate levels in all CNS regions examined. The monocarboxylate transporters have been implicated in post-ischemic neuronal loss in stroke, such that blockade of these transporters increase stroke-related damage. Thus, this gene is an excellent drug target, such that increasing its activity may decrease postischemic damage in stroke/cerebral infarct.

Schurr A, Payne RS, Miller JJ, Tseng MT, Rigor BM. Blockade of lactate transport exacerbates delayed neuronal damage in a rat model of cerebral ischemia. Brain Res 2001 Mar 23;895(1-2):268-72

Studies over the past decade have demonstrated that lactate is produced aerobically during brain activation and it has been suggested to be an obligatory aerobic energy substrate postischemia. It has been also hypothesized, based on in vitro studies, that lactate, produced by glia in large amounts during activation and/or ischemia/hypoxia, is transported via specific glial and neuronal monocarboxylate transporters into neurons for aerobic utilization. To test

the role of lactate as an aerobic energy substrate postischemia in vivo, we employed the cardiac-arrest-induced transient global cerebral ischemia (TGI) rat model and the monocarboxylate transporter inhibitor alpha-cyano-4-hydroxycinnamate (4-CIN). Once 4-CIN was established to cross the blood-brain barrier, rats were treated with the inhibitor 60 min prior to a 5-min TGI. These rats exhibited a significantly greater degree of delayed neuronal damage in the hippocampus than control, untreated rats, as measured 7 days post-TGI. We concluded that intra-ischemically-accumulated lactate is utilized aerobically as the main energy substrate immediately postischemia. Blockade of lactate transport into neurons prevents its utilization and, consequently, exacerbates delayed ischemic neuronal damage.

#### 10 NOV97c and NOV97d

Expression of gene NOV97c and variant NOV97d was assessed using the primer-probe set Ag3697, described in Table CLA. Results of the RTQ-PCR runs are shown in Table CLB.

**Table CLA. Probe Name Ag3697**

**CNS\_neurodegeneration\_v1.0 Summary:** Ag3697 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

**General\_screening\_panel\_v1.4 Summary:** Ag3697 Expression of this gene is highest in and almost exclusive to testis (CT = 30.7). Therefore, expression of this gene could be used to distinguish testis from the other samples on this panel. Moreover, therapeutic modulation of the activity of this gene or its protein product using protein therapeutics, antibodies or small molecule drugs could be of benefit in the treatment of infertility.

**Panel 4.1D Summary:** Ag3697 Expression of this gene is low/undetectable (CTs > 35) across all of the samples on this panel (data not shown).

#### NOV98: AGRIN

Expression of gene NOV98 was assessed using the primer-probe set Ag3974, described in Table CMA. Results of the RTQ-PCR runs are shown in Tables CMB, CMC and CMD.

**Table CMA. Probe Name Ag3974**

5 **CNS\_neurodegeneration\_v1.0 Summary:** Ag3974 This panel does not show differential expression of the NOV98 gene in Alzheimer's disease. However, this expression profile confirms the presence of this gene in the brain. Please see Panel 1.3D for discussion of utility of this gene in the central nervous system.

10 **General\_screening\_panel\_v1.4 Summary:** Ag3974 The expression of the NOV98 gene appears to be highest in a sample derived from a breast cancer cell line (T47D) (CT=22.5). In addition, there appears to be substantial expression in other samples derived from breast cancer cell lines, ovarian cancer cell lines, kidney cancer cell lines, lung cancer cell lines, colon cancer cell lines and brain cancer cell lines. Thus, the expression of this gene could be used to distinguish T47D cells from other samples in the panel. Moreover, therapeutic modulation of this gene, through the use of small molecule drugs, protein therapeutics, or antibodies could be of benefit in the treatment of breast, ovarian, kidney, lung, colon or brain cancer.

15 Among metabolic tissues, this gene has low-to-moderate levels of expression in adrenal, pituitary, adult and fetal heart, adult and fetal liver, adult and fetal skeletal muscle, and adipose. This gene product has high levels of expression (CT values = 27) in pancreas and thyroid. Thus, this gene product may be important for the pathogenesis, diagnosis, and/or treatment of metabolic and endocrine diseases, including obesity, Types 1 and 2 diabetes and thyroidopathies. It has recently been reported that an agrin minigene rescued dystrophic symptoms in a mouse model of muscular dystrophy. Therefore, this gene product may also be used as a treatment or cure for congenital muscular dystrophies.

20 This gene is also expressed at moderate to high levels in all regions of the CNS. This molecule is a homolog of agrin, which has been implicated in the formation of senile plaques in Alzheimer's disease and in the acetylcholine synapse/neuromuscular junction. This gene is

therefore an excellent drug target in AD or in any disease involving the neuromuscular junction or the acetylcholine system.

5 MA. An agrin minigene rescues dystrophic symptoms in a mouse model for congenital  
muscular dystrophy. *Nature*. 2001 Sep 20;413(6853):302-7.

Congenital muscular dystrophy is a heterogeneous and severe, progressive muscle-  
wasting disease that frequently leads to death in early childhood. Most cases of congenital  
muscular dystrophy are caused by mutations in LAMA2, the gene encoding the alpha2 chain  
10 of the main laminin isoforms expressed by muscle fibres. Muscle fibre deterioration in this  
disease is thought to be caused by the failure to form the primary laminin scaffold, which is  
necessary for basement membrane structure, and the missing interaction between muscle  
basement membrane and the dystrophin-glycoprotein complex (DGC) or the integrins. With  
the aim to restore muscle function in a mouse model for this disease, we have designed a  
15 minigene of agrin, a protein known for its role in the formation of the neuromuscular junction.  
Here we show that this mini-agrin-which binds to basement membrane and to alpha-  
dystroglycan, a member of the DGC-amends muscle pathology by a mechanism that includes  
agrin-mediated stabilization of alpha-dystroglycan and the laminin alpha5 chain. Our data  
provides in vivo evidence that a non-homologous protein in combination with rational protein  
20 design can be used to devise therapeutic tools that may restore muscle function in human  
muscular dystrophies.

Liyanage Y, Hoch W, Beeson D, Vincent A. The agrin/muscle-specific kinase  
pathway: New targets for autoimmune and genetic disorders at the neuromuscular junction.  
25 *Muscle Nerve* 2002 Jan;25(1):4-16

The increasing understanding of the structural complexity of the neuromuscular  
junction (NMJ), and the processes that are important in its development, suggests many  
possible new disease targets. Here, we summarize briefly the genetic and autoimmune  
disorders that affect neuromuscular transmission, and the identified targets, including new  
30 evidence that antibodies to muscle-specific receptor tyrosine kinase (MuSK) are involved in  
the pathogenesis of acetylcholine receptor (AChR) antibody-negative myasthenia gravis. We  
then review the development of the NMJ, focusing on the important roles of nerve-derived  
agrin and MuSK in clustering of AChRs and other essential components of the NMJ.

van Horssen J, Otte-Holler I, David G, Maat-Schieman ML, van den Heuvel LP, Wesseling P, de Waal RM, Verbeek MM. Heparan sulfate proteoglycan expression in cerebrovascular amyloid beta deposits in Alzheimer's disease and hereditary cerebral hemorrhage with amyloidosis (Dutch) brains. *Acta Neuropathol (Berl)* 2001 Dec;102(6):604-

5 14

Cerebrovascular deposition of amyloid beta protein (A beta) is a characteristic lesion of Alzheimer's disease (AD) and hereditary cerebral hemorrhage with amyloidosis of the Dutch type (HCHWA-D). Besides A beta, several other proteins and proteoglycans accumulate in cerebral amyloid angiopathy (CAA). We have now analyzed the expression of the heparan sulfate proteoglycan (HSPG) subtypes agrin, perlecan, glypican-1, syndecans 1-3 and HS glycosaminoglycan (GAG) side chains in CAA in brains of patients with AD and HCHWA-D. Hereto, specific well-characterized antibodies directed against the core protein of these HSPGs and against the GAG side chains were used for immunostaining. Glypican-1 was abundantly expressed in CAA both in AD and HCHWA-D brains, whereas perlecan and syndecans-1 and -3 were absent in both. Colocalization of agrin with vascular A beta was clearly observed in CAA in HCHWA-D brains, but only in a minority of the AD cases. Conversely, syndecan-2 was frequently associated with vascular A beta in AD, but did not colocalize with vascular A beta deposits in HCHWA-D. The three different syndecans, agrin, glypican-1 and HS GAG, but not perlecan, were associated with the majority of senile plaques (SPs) in all brains. Our results suggest a role for agrin in the formation of SPs and of CAA in HCHWA-D, but not in the pathogenesis of CAA in AD. Both syndecan-2 and glypican, but not perlecan, may be involved in the formation of CAA. We conclude that specific HSPG species may be involved in the pathogenesis of CAA in both AD and HCHWA-D, and that the pathogenesis of CAA and SPs may differ with regard to the involvement of HSPG species:

25 **Panel 4.1D Summary:** Ag3974 The NOV98 gene is expressed at moderate levels (CT=29-32) in a wide range of cell types of significance in the immune response in health and disease. Therefore, targeting of this gene product with a small molecule drug or antibody therapeutic may modulate the functions of cells of the immune system as well as resident tissue cells and lead to improvement of the symptoms of patients suffering from autoimmune and inflammatory diseases such as COPD, emphysema, asthma, allergies, inflammatory bowel disease, lupus erythematosus, and arthritis, including osteoarthritis and rheumatoid arthritis. Based on its homology to agrin, this gene product may also be beneficial to the treatment of multiple sclerosis as suggested by the referene below.

#### References:

Liyanage Y, Hoch W, Beeson D, Vincent A. The agrin/muscle-specific kinase pathway: New targets for autoimmune and genetic disorders at the neuromuscular junction. Muscle Nerve 2002 Jan;25(1):4-16

5 The increasing understanding of the structural complexity of the neuromuscular junction (NMJ), and the processes that are important in its development, suggests many possible new disease targets. Here, we summarize briefly the genetic and autoimmune disorders that affect neuromuscular transmission, and the identified targets, including new evidence that antibodies to muscle-specific receptor tyrosine kinase (MuSK) are involved in the pathogenesis of acetylcholine receptor (AChR) antibody-negative myasthenia gravis. We  
10 then review the development of the NMJ, focusing on the important roles of nerve-derived agrin and MuSK in clustering of AChRs and other essential components of the NMJ.

### Example 3. SNP analysis of NOVX clones

SeqCalling™ Technology: cDNA was derived from various human samples  
15 representing multiple tissue types, normal and diseased states, physiological states, and developmental states from different donors. Samples were obtained as whole tissue, cell lines, primary cells or tissue cultured primary cells and cell lines. Cells and cell lines may have been treated with biological or chemical agents that regulate gene expression for example, growth factors, chemokines, steroids. The cDNA thus derived was then sequenced using CuraGen's  
20 proprietary SeqCalling technology. Sequence traces were evaluated manually and edited for corrections if appropriate. cDNA sequences from all samples were assembled with themselves and with public ESTs using bioinformatics programs to generate CuraGen's human SeqCalling database of SeqCalling assemblies. Each assembly contains one or more overlapping cDNA sequences derived from one or more human samples. Fragments and ESTs were included as  
25 components for an assembly when the extent of identity with another component of the assembly was at least 95% over 50 bp. Each assembly can represent a gene and/or its variants such as splice forms and/or single nucleotide polymorphisms (SNPs) and their combinations.

Variant sequences are included in this application. A variant sequence can include a single nucleotide polymorphism (SNP). A SNP can, in some instances, be referred to as a  
30 "cSNP" to denote that the nucleotide sequence containing the SNP originates as a cDNA. A SNP can arise in several ways. For example, a SNP may be due to a substitution of one nucleotide for another at the polymorphic site. Such a substitution can be either a transition or a transversion. A SNP can also arise from a deletion of a nucleotide or an insertion of a

nucleotide, relative to a reference allele. In this case, the polymorphic site is a site at which one allele bears a gap with respect to a particular nucleotide in another allele. SNPs occurring within genes may result in an alteration of the amino acid encoded by the gene at the position of the SNP. Intragenic SNPs may also be silent, however, in the case that a codon including a  
5 SNP encodes the same amino acid as a result of the redundancy of the genetic code. SNPs occurring outside the region of a gene, or in an intron within a gene, do not result in changes in any amino acid sequence of a protein but may result in altered regulation of the expression pattern for example, alteration in temporal expression, physiological response regulation, cell type expression regulation, intensity of expression, stability of transcribed message.

10 **Method of novel SNP Identification:** SNPs are identified by analyzing sequence assemblies using CuraGen's proprietary SNPTool algorithm. SNPTool identifies variation in assemblies with the following criteria: SNPs are not analyzed within 10 base pairs on both ends of an alignment; Window size (number of bases in a view) is 10; The allowed number of mismatches in a window is 2; Minimum SNP base quality (PHRED score) is 23; Minimum  
15 number of changes to score an SNP is 2/assembly position. SNPTool analyzes the assembly and displays SNP positions, associated individual variant sequences in the assembly, the depth of the assembly at that given position, the putative assembly allele frequency, and the SNP sequence variation. Sequence traces are then selected and brought into view for manual validation. The consensus assembly sequence is imported into CuraTools along with variant  
20 sequence changes to identify potential amino acid changes resulting from the SNP sequence variation. Comprehensive SNP data analysis is then exported into the SNPCalling database.

**Method of novel SNP Confirmation:** SNPs are confirmed employing a validated method known as Pyrosequencing (Pyrosequencing, Westborough, MA). Detailed protocols for Pyrosequencing can be found in: Alderborn et al. Determination of Single Nucleotide  
25 Polymorphisms by Real-time Pyrophosphate DNA Sequencing. (2000). *Genome Research*. 10, Issue 8, August. 1249-1265. In brief, Pyrosequencing is a real time primer extension process of genotyping. This protocol takes double-stranded, biotinylated PCR products from genomic DNA samples and binds them to streptavidin beads. These beads are then denatured producing single stranded bound DNA. SNPs are characterized utilizing a technique based on an indirect  
30 bioluminometric assay of pyrophosphate (PPi) that is released from each dNTP upon DNA chain elongation. Following Klenow polymerase-mediated base incorporation, PPi is released and used as a substrate, together with adenosine 5'-phosphosulfate (APS), for ATP sulfurylase, which results in the formation of ATP. Subsequently, the ATP accomplishes the conversion of luciferin to its oxi-derivative by the action of luciferase. The ensuing light output becomes

proportional to the number of added bases, up to about four bases. To allow processivity of the method dNTP excess is degraded by apyrase, which is also present in the starting reaction mixture, so that only dNTPs are added to the template during the sequencing. The process has been fully automated and adapted to a 96-well format, which allows rapid screening of large SNP panels. The DNA and protein sequences for the novel single nucleotide polymorphic variants are reported. Variants are reported individually but any combination of all or a select subset of variants are also included. In addition, the positions of the variant bases and the variant amino acid residues are underlined.

### Results

Variants are reported individually but any combination of all or a select subset of variants are also included as contemplated NOVX embodiments of the invention.

#### NOV1a SNP data:

NOV1a has two SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:1 and 2, respectively. The nucleotide sequence of the NOV1a variant differs as shown in Table 101.

| Table 101. cSNP and Coding Variants for NOV1a |              |            |                     |                           |
|-----------------------------------------------|--------------|------------|---------------------|---------------------------|
| NT Position of cSNP                           | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change         |
| 393                                           | T            | C          | 130                 | S->P                      |
| 420                                           | T            | C          | 139                 | W->R                      |
| 431                                           | T            | C          | 142                 | No change                 |
| 501                                           | C            | T          | 166                 | L->F                      |
| NT Position of cSNP                           | Wild Type NT | Variant NT | Depth               | Putative Allele Frequency |
| 420                                           | T            | C          | 20                  | 0.100                     |

#### NOV1b SNP data:

NOV1b has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:3 and 4, respectively. The nucleotide sequence of the NOV1b variant differs as shown in Table 102.

| Table 102. cSNP and Coding Variants for NOV1b |              |            |                     |                   |
|-----------------------------------------------|--------------|------------|---------------------|-------------------|
| NT Position of cSNP                           | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
| 393                                           | T            | C          | 130                 | S->P              |
| 420                                           | T            | C          | 139                 | W->R              |

**NOV3a SNP data:**

NOV3a has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:11 and 12, respectively. The nucleotide sequence of the NOV3a variant differs as shown in Table 103.

**Table 103. cSNP and Coding Variants for NOV3a**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
|---------------------|--------------|------------|---------------------|-------------------|
| 212                 | T            | C          | 54                  | C->R              |
| 439                 | A            | G          | 149                 | No Change         |

**NOV4a SNP data:**

NOV4a has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:17 and 18, respectively. The nucleotide sequence of the NOV4a variant differs as shown in Table 104.

**Table 104. cSNP and Coding Variants for NOV4a**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
|---------------------|--------------|------------|---------------------|-------------------|
| 229                 | G            | A          | 73                  | No change         |
| 390                 | G            | A          | 127                 | W->End            |
| 631                 | G            | C          | 207                 | Q->H              |

**NOV5a SNP data:**

NOV5a has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:23 and 24, respectively. The nucleotide sequence of the NOV5a variant differs as shown in Table 105.

**Table 105. cSNP and Coding Variants for NOV5a**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
|---------------------|--------------|------------|---------------------|-------------------|
| 79                  | C            | T          | 19                  | A->V              |
| 204                 | T            | C          | 61                  | No change         |
| 658                 | A            | T          | 212                 | Q->L              |
| 884                 | C            | G          | 287                 | No change         |
| 1149                | G            | T          | 376                 | D->Y              |

**NOV6 SNP data:**

NOV6 has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:33 and 34, respectively. The nucleotide sequence of the NOV6 variant differs as shown in Table 106.

**Table 106. cSNP and Coding Variants for NOV6**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
|---------------------|--------------|------------|---------------------|-------------------|
| 543                 | T            | C          | 156                 | V->A              |
| 549                 | T            | C          | 158                 | I->T              |
| 660                 | C            | T          | 195                 | A->V              |
| 734                 | A            | G          | 220                 | T->A              |
| 782                 | G            | A          | 236                 | A->T              |

**NOV7a SNP data:**

NOV7a has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:35 and 36, respectively. The nucleotide sequence of the NOV7a variant differs as shown in Table 107.

**Table 107. cSNP and Coding Variants for NOV7a**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid Position | Amino Acid Change         |
|---------------------|--------------|------------|---------------------|---------------------------|
| 168                 | T            | C          | 24                  | V->G                      |
| 459                 | C            | T          | 121                 | A->V                      |
| 815                 | T            | C          | 240                 | S->P                      |
| 896                 | A            | G          | N/A                 | No change                 |
| NT Position of cSNP | Wild Type NT | Variant NT | Depth               | Putative Allele Frequency |
| 428                 | G            | A          | 8                   | 0.250                     |

**NOV7c SNP data:**

NOV7c has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:39 and 40, respectively. The nucleotide sequence of the NOV7c variant differs as shown in Table 108.

**Table 108. cSNP and Coding Variants for NOV7c**

| NT Position of cSNP | Wild Type NT | Variant NT | Depth | Putative Allele Frequency |
|---------------------|--------------|------------|-------|---------------------------|
| 383                 | C            | T          | 5     | 0.400                     |

**NOV7d SNP data:**

NOV7d has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:41 and 42, respectively. The nucleotide sequence of the NOV7d variant differs as shown in Table 109.

**Table 109. cSNP and Coding Variants for NOV7d**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid Position | Amino Acid Change |
|---------------------|--------------|------------|---------------------|-------------------|
| 260                 | G            | A          | 86                  | I->E              |

**NOV7e SNP data:**

NOV7e has four SNP variants, whose variant positions for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:323 and 324, respectively. The nucleotide sequence of the NOV7d variant differs as shown in Table 110.

**Table 110. cSNP and Coding Variants for NOV7e**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid Position | Amino Acid Change |
|---------------------|--------------|------------|---------------------|-------------------|
| 304                 | A            | G          | 102                 | T->A              |

**NOV9a SNP data:**

NOV9a has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:45 and 46, respectively. The nucleotide sequence of the NOV9a variant differs as shown in Table 111.

**Table 111. cSNP and Coding Variants for NOV9a**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |

| 1338                | G            | A          | 323                 | No change         |

**NOV10 SNP data:**

NOV10 has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:49 and 50, respectively. The nucleotide sequence of the NOV10 variant differs as shown in Table 112.

| Table 112. cSNP and Coding Variants for NOV10 |              |            |       |                           |
|-----------------------------------------------|--------------|------------|-------|---------------------------|
| NT Position of cSNP                           | Wild Type NT | Variant NT | Depth | Putative Allele Frequency |
| 335                                           | G            | A          | 10    | 0.400                     |

**NOV13b SNP data:**

- NOV13b has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:57 and 58, respectively. The nucleotide sequence of the NOV13b variant differs as shown in Table 113.

| Table 113. cSNP and Coding Variants for NOV13b |              |            |       |                           |
|------------------------------------------------|--------------|------------|-------|---------------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Depth | Putative Allele Frequency |
| 362                                            | G            | A          | 11    | 0.455                     |

**NOV15b SNP data:**

- NOV15b has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:63 and 64, respectively. The nucleotide sequence of the NOV15b variant differs as shown in Table 114.

| Table 114. cSNP and Coding Variants for NOV15b |              |            |       |                           |
|------------------------------------------------|--------------|------------|-------|---------------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Depth | Putative Allele Frequency |

**NOV21a SNP data:**

- NOV21a has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:87 and 88, respectively. The nucleotide sequence of the NOV21a variant differs as shown in Table 116.

| Table 116. cSNP and Coding Variants for NOV21a |              |            |                     |                   |
|------------------------------------------------|--------------|------------|---------------------|-------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
| 121                                            | T            | C          | 41                  | W->R              |

**NOV21b SNP data:**

- NOV21b has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:89 and 90, respectively. The nucleotide sequence of the NOV21b variant differs as shown in Table 117.

| Table 117. cSNP and Coding Variants for NOV21b |              |            |       |                           |

**NOV22c SNP data:**

NOV22c has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:95 and 96, respectively. The nucleotide sequence of the NOV22c variant differs as shown in Table 119.

5

| 540                                                   | C                   | T                 | 29           | 0.241                            |

**NOV24a SNP data:**

NOV24a has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:103 and 104, respectively. The nucleotide sequence of the NOV24a variant differs as shown in Table 120.

10

| <b>Table 120. cSNP and Coding Variants for NOV24a</b> |                     |                   |                            |                          |

**NOV24b SNP data:**

NOV24b has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:105 and 106, respectively. The nucleotide sequence of the NOV24b variant differs as shown in Table 121.

15

**NOV27a SNP data:**

NOV27a has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:113 and 114, respectively. The nucleotide sequence of the NOV27a variant differs as shown in Table 125.

| Table 125. cSNP and Coding Variants for NOV27a |              |            |                     |                   |
|------------------------------------------------|--------------|------------|---------------------|-------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
| 158                                            | A            | T          | 36                  | No change         |
| 491                                            | C            | T          | 147                 | No change         |

**NOV27b SNP data:**

NOV27b has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:115 and 116, respectively. The nucleotide sequence of the NOV27b variant differs as shown in Table 126.

| Table 126. cSNP and Coding Variants for NOV27b |              |            |       |                           |
|------------------------------------------------|--------------|------------|-------|---------------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Depth | Putative Allele Frequency |

**NOV29c SNP data:**

NOV29c has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:125 and 126, respectively. The nucleotide sequence of the NOV29c variant differs as shown in Table 127.

5

| <b>Table 127. cSNP and Coding Variants for NOV29c</b> |                     |                   |                            |                          |

#### NOV43 SNP data:

NOV43 has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:165 and 166, respectively. The nucleotide sequence of the NOV43 variant differs as shown in Table 135.

15

| Table 135. cSNP and Coding Variants for NOV43 |              |            |                     |                   |
|-----------------------------------------------|--------------|------------|---------------------|-------------------|
| NT Position of cSNP                           | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
| 378                                           | G            | A          | 121                 | No change         |
| 496                                           | G            | A          | 162                 | R->Q              |

#### NOV46b SNP data:

NOV46b has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:173 and 174, respectively. The nucleotide sequence of the NOV46b variant differs as shown in Table 136.

| Table 136. cSNP and Coding Variants for NOV46b |              |            |                     |                           |
|------------------------------------------------|--------------|------------|---------------------|---------------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change         |
| 500                                            | C            | T          | 163                 | No change                 |
| NT Position of cSNP                            | Wild Type NT | Variant NT | Depth               | Putative Allele Frequency |
| 486                                            | C            | T          | 16                  | 0.125                     |

5

#### NOV48a SNP data:

NOV48a has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:181 and 182, respectively. The nucleotide sequence of the NOV48a variant differs as shown in Table 137.

10

| Table 137. cSNP and Coding Variants for NOV48a |              |            |                     |                   |
|------------------------------------------------|--------------|------------|---------------------|-------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |

| 2656                                           | G            | A          | N/A                 | No change         |

#### NOV50b SNP data:

NOV50b has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:189 and 190, respectively. The nucleotide sequence of the NOV50b variant differs as shown in Table 138.

15

| Table 138. cSNP and Coding Variants for NOV50b |              |            |                     |                   |
|------------------------------------------------|--------------|------------|---------------------|-------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
| 797                                            | A            | G          | 265                 | Q->R              |

**NOV52 SNP data:**

- NOV52 has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:193 and 194, respectively. The nucleotide sequence of the NOV52 variant differs as shown in Table 139.

| Table 139. cSNP and Coding Variants for NOV52 |              |            |                     |                           |
|-----------------------------------------------|--------------|------------|---------------------|---------------------------|
| NT Position of cSNP                           | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change         |
| 318                                           | T            | C          | 48                  | No change                 |
| 351                                           | C            | T          | 59                  | R->C                      |
| 1961                                          | G            | T          | 595                 | M->I                      |
| NT Position of cSNP                           | Wild Type NT | Variant NT | Depth               | Putative Allele Frequency |
| 70                                            | C            | T          | 54                  | 0.056                     |

**NOV56a SNP data:**

- NOV56a has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:203 and 204, respectively. The nucleotide sequence of the NOV56a variant differs as shown in Table 140.

| Table 140. cSNP and Coding Variants for NOV56a |              |            |                     |                   |
|------------------------------------------------|--------------|------------|---------------------|-------------------|
| NT Position of cSNP                            | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |

**NOV57 SNP data:**

- NOV57 has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:207 and 208, respectively. The nucleotide sequence of the NOV57 variant differs as shown in Table 141.

**Table 141. cSNP and Coding Variants for NOV57**

| NT Position of cSNP | Wild Type NT | Variant NT | Amino Acid position | Amino Acid Change |
|---------------------|--------------|------------|---------------------|-------------------|
| 939                 | T            | A          | N/A                 | No change         |

**NOV58b SNP data:**

- 5 NOV58b has one SNP variant, whose variant position for its nucleotide and amino acid sequences is numbered according to SEQ ID NOs:211 and 212, respectively. The nucleotide sequence of the NOV58b variant differs as shown in Table 142.

**Table 142. cSNP and Coding Variants for NOV58b**

| NT Position of cSNP | Wild Type NT | Variant NT | Depth | Putative Allele Frequency |
|---------------------|--------------|------------|-------|---------------------------|
| 88                  | T            | C          | 11    | 0.273                     |

#### Example 4. In-frame Cloning

##### NOV7c

For NOV7c the cDNA coding for the DOMAIN of NOV7c from residues 1 to 230 was targeted for "in-frame" cloning by PCR. The PCR template was based on the previously identified plasmid, when available, or on human cDNA(s).

10

**Table 145. Oligonucleotide primers used to clone the target cDNA sequence:**

| Primers | Sequences                                                     |
|---------|---------------------------------------------------------------|
| F1      | 5'- AGATCTCCACC ATGGAATTCAGGACCTGGAAGTGC -3' (SEQ ID NO:1382) |
| R1      | 5'- CTCGAG TCCACTTACAATTTCCCGTCTGATTTC -3' (SEQ ID NO:1385)   |
| SF1     | 5'- TCCTCCTGGAGAAAGCTCAGAATCTGTTTT -3' (SEQ ID NO:1387)       |
| SF2     | 5'- CTCCAGATTGGAAAGTTCTGAGGAA -3' (SEQ ID NO:1388)            |
| SR1     | 5'- ATTTCTCCAAGTCCCAGGCC -3' (SEQ ID NO:1389)                 |
| SR2     | 5'- GAGCCTGTTCTAGAAGGAGCTGTTG -3' (SEQ ID NO:1390)            |

For downstream cloning purposes, the forward primer includes an in-frame Hind III restriction site and the reverse primer contains an in-frame Xho I restriction site.

15

Two parallel PCR reactions were set up using a total of 0.5-1.0 ng human pooled cDNAs as template for each reaction. The pool is composed of 5 micrograms of each of the following human tissue cDNAs: adrenal gland, whole brain, amygdala, cerebellum, thalamus, bone marrow, fetal brain, fetal kidney, fetal liver, fetal lung, heart, kidney, liver, lymphoma, Burkitt's Raji cell line, mammary gland, pancreas, pituitary gland, placenta, prostate, salivary gland, skeletal muscle, small Intestine, spleen, stomach, thyroid, trachea, uterus.

20

When the tissue of expression is known and available, the second PCR was performed using the above primers and 0.5ng-1.0 ng of one of the following human tissue cDNAs:

skeleton muscle, testis, mammary gland, adrenal gland, ovary, colon, normal cerebellum, normal adipose, normal skin, bone marrow, brain amygdala, brain hippocampus, brain substantia nigra, brain thalamus, thyroid, fetal lung, fetal liver, fetal brain, kidney, heart, spleen, uterus, pituitary gland, lymph node, salivary gland, small intestine, prostate, placenta, spinal cord, peripheral blood, trachea, stomach, pancreas, hypothalamus.

The reaction mixtures contained 2 microliters of each of the primers (original concentration: 5 pmol/ul), 1 microliter of 10mM dNTP (Clontech Laboratories, Palo Alto CA) and 1 microliter of 50xAdvantage-HF 2 polymerase (Clontech Laboratories) in 50 microliter-reaction volume. The following reaction conditions were used:

PCR condition 1:

- a) 96°C 3 minutes
- b) 96°C 30 seconds denaturation
- c) 60°C 30 seconds, primer annealing
- d) 72°C 6 minutes extension

Repeat steps b-d 15 times

- e) 96°C 15 seconds denaturation
- f) 60°C 30 seconds, primer annealing
- g) 72°C 6 minutes extension

Repeat steps e-g 29 times

- e) 72°C 10 minutes final extension

PCR condition 2:

- a) 96°C 3 minutes
- b) 96°C 15 seconds denaturation
- c) 76°C 30 seconds, primer annealing, reducing the temperature by 1 °C per cycle
- d) 72°C 4 minutes extension

Repeat steps b-d 34 times

- e) 72°C 10 minutes final extension

**Example 5: SAGE Analysis**

Hs.181638 : ESTs, Weakly similar to SSR1\_HUMAN SOMATOSTATIN RECEPTOR TYPE 1 [H.sapiens]

### OTHER EMBODIMENTS

Although particular embodiments have been disclosed herein in detail, this has been done by way of example for purposes of illustration only, and is not intended to be limiting with respect to the scope of the appended claims, which follow. In particular, it is

5 contemplated by the inventors that various substitutions, alterations, and modifications may be made to the invention without departing from the spirit and scope of the invention as defined by the claims. The choice of nucleic acid starting material, clone of interest, or library type is believed to be a matter of routine for a person of ordinary skill in the art with knowledge of the

10 embodiments described herein. Other aspects, advantages, and modifications considered to be within the scope of the following claims.

**WHAT IS CLAIMED IS:**

1. An isolated polypeptide comprising an amino acid sequence selected from the group consisting of:
  - (a) a mature form of an amino acid sequence selected from the group consisting of SEQ ID NOS:2n, wherein n is an integer between 1 and 162;
  - (b) a variant of a mature form of an amino acid sequence selected from the group consisting of SEQ ID NOS:2n, wherein n is an integer between 1 and 162, wherein one or more amino acid residues in said variant differs from the amino acid sequence of said mature form, provided that said variant differs in no more than 15% of the amino acid residues from the amino acid sequence of said mature form;
  - (c) an amino acid sequence selected from the group consisting SEQ ID NOS:2n, wherein n is an integer between 1 and 162; and
  - (d) a variant of an amino acid sequence selected from the group consisting of SEQ ID NOS:2n, wherein n is an integer between 1 and 162, wherein one or more amino acid residues in said variant differs from the amino acid sequence of said mature form, provided that said variant differs in no more than 15% of amino acid residues from said amino acid sequence.
2. The polypeptide of claim 1, wherein said polypeptide comprises the amino acid sequence of a naturally-occurring allelic variant of an amino acid sequence selected from the group consisting SEQ ID NOS:2n, wherein n is an integer between 1 and 162.
3. The polypeptide of claim 2, wherein said allelic variant comprises an amino acid sequence that is the translation of a nucleic acid sequence differing by a single nucleotide from a nucleic acid sequence selected from the group consisting of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162.
4. The polypeptide of claim 1, wherein the amino acid sequence of said variant comprises a conservative amino acid substitution.

5. An isolated nucleic acid molecule comprising a nucleic acid sequence encoding a polypeptide comprising an amino acid sequence selected from the group consisting of:
  - (a) a mature form of an amino acid sequence selected from the group consisting of SEQ ID NOS:2n, wherein n is an integer between 1 and 162;
  - (b) a variant of a mature form of an amino acid sequence selected from the group consisting of SEQ ID NOS:2n, wherein n is an integer between 1 and 162, wherein one or more amino acid residues in said variant differs from the amino acid sequence of said mature form, provided that said variant differs in no more than 15% of the amino acid residues from the amino acid sequence of said mature form;
  - (c) an amino acid sequence selected from the group consisting of SEQ ID NOS:2n, wherein n is an integer between 1 and 162;
  - (d) a variant of an amino acid sequence selected from the group consisting SEQ ID NOS:2n, wherein n is an integer between 1 and 162, wherein one or more amino acid residues in said variant differs from the amino acid sequence of said mature form, provided that said variant differs in no more than 15% of amino acid residues from said amino acid sequence;
  - (e) a nucleic acid fragment encoding at least a portion of a polypeptide comprising an amino acid sequence chosen from the group consisting of SEQ ID NOS:2n, wherein n is an integer between 1 and 162, or a variant of said polypeptide, wherein one or more amino acid residues in said variant differs from the amino acid sequence of said mature form, provided that said variant differs in no more than 15% of amino acid residues from said amino acid sequence; and
  - (f) a nucleic acid molecule comprising the complement of (a), (b), (c), (d) or (e).
6. The nucleic acid molecule of claim 5, wherein the nucleic acid molecule comprises the nucleotide sequence of a naturally-occurring allelic nucleic acid variant.
7. The nucleic acid molecule of claim 5, wherein the nucleic acid molecule encodes a polypeptide comprising the amino acid sequence of a naturally-occurring polypeptide variant.

8. The nucleic acid molecule of claim 5, wherein the nucleic acid molecule differs by a single nucleotide from a nucleic acid sequence selected from the group consisting of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162.
9. The nucleic acid molecule of claim 5, wherein said nucleic acid molecule comprises a nucleotide sequence selected from the group consisting of:
  - (a) a nucleotide sequence selected from the group consisting of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162;
  - (b) a nucleotide sequence differing by one or more nucleotides from a nucleotide sequence selected from the group consisting of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, provided that no more than 20% of the nucleotides differ from said nucleotide sequence;
  - (c) a nucleic acid fragment of (a); and
  - (d) a nucleic acid fragment of (b).
10. The nucleic acid molecule of claim 5, wherein said nucleic acid molecule hybridizes under stringent conditions to a nucleotide sequence chosen from the group consisting of SEQ ID NOS:2n-1, wherein n is an integer between 1 and 162, or a complement of said nucleotide sequence.
11. The nucleic acid molecule of claim 5, wherein the nucleic acid molecule comprises a nucleotide sequence selected from the group consisting of:
  - (a) a first nucleotide sequence comprising a coding sequence differing by one or more nucleotide sequences from a coding sequence encoding said amino acid sequence, provided that no more than 20% of the nucleotides in the coding sequence in said first nucleotide sequence differ from said coding sequence;
  - (b) an isolated second polynucleotide that is a complement of the first polynucleotide; and
  - (c) a nucleic acid fragment of (a) or (b).
12. A vector comprising the nucleic acid molecule of claim 11.
13. The vector of claim 12, further comprising a promoter operably-linked to said nucleic acid molecule.

14. A cell comprising the vector of claim 12.
15. An antibody that binds immunospecifically to the polypeptide of claim 1.
16. The antibody of claim 15, wherein said antibody is a monoclonal antibody.
17. The antibody of claim 15, wherein the antibody is a humanized antibody.
18. A method for determining the presence or amount of the polypeptide of claim 1 in a sample, the method comprising:
  - (a) providing the sample;
  - (b) contacting the sample with an antibody that binds immunospecifically to the polypeptide; and
  - (c) determining the presence or amount of antibody bound to said polypeptide, thereby determining the presence or amount of polypeptide in said sample.
19. A method for determining the presence or amount of the nucleic acid molecule of claim 5 in a sample, the method comprising:
  - (a) providing the sample;
  - (b) contacting the sample with a probe that binds to said nucleic acid molecule; and
  - (c) determining the presence or amount of the probe bound to said nucleic acid molecule, thereby determining the presence or amount of the nucleic acid molecule in said sample.
20. The method of claim 19 wherein presence or amount of the nucleic acid molecule is used as a marker for cell or tissue type.
21. The method of claim 20 wherein the cell or tissue type is cancerous.
22. A method of identifying an agent that binds to a polypeptide of claim 1, the method comprising:
  - (a) contacting said polypeptide with said agent; and
  - (b) determining whether said agent binds to said polypeptide.

23. The method of claim 22 wherein the agent is a cellular receptor or a downstream effector.
24. A method for identifying an agent that modulates the expression or activity of the polypeptide of claim 1, the method comprising:
- (a) providing a cell expressing said polypeptide;
  - (b) contacting the cell with said agent, and
  - (c) determining whether the agent modulates expression or activity of said polypeptide,
- whereby an alteration in expression or activity of said peptide indicates said agent modulates expression or activity of said polypeptide.
25. A method for modulating the activity of the polypeptide of claim 1, the method comprising contacting a cell sample expressing the polypeptide of said claim with a compound that binds to said polypeptide in an amount sufficient to modulate the activity of the polypeptide.
26. A method of treating or preventing a NOVX-associated disorder, said method comprising administering to a subject in which such treatment or prevention is desired the polypeptide of claim 1 in an amount sufficient to treat or prevent said NOVX-associated disorder in said subject.
27. The method of claim 26 wherein the disorder is selected from the group consisting of cardiomyopathy and atherosclerosis.
28. The method of claim 26 wherein the disorder is related to cell signal processing and metabolic pathway modulation.
29. The method of claim 26, wherein said subject is a human.
30. A method of treating or preventing a NOVX-associated disorder, said method comprising administering to a subject in which such treatment or prevention is desired the nucleic acid of claim 5 in an amount sufficient to treat or prevent said NOVX-associated disorder in said subject.

31. The method of claim 30 wherein the disorder is selected from the group consisting of cardiomyopathy and atherosclerosis.
32. The method of claim 30 wherein the disorder is related to cell signal processing and metabolic pathway modulation.
33. The method of claim 30, wherein said subject is a human.
34. A method of treating or preventing a NOVX-associated disorder, said method comprising administering to a subject in which such treatment or prevention is desired the antibody of claim 15 in an amount sufficient to treat or prevent said NOVX-associated disorder in said subject.
35. The method of claim 34 wherein the disorder is diabetes.
36. The method of claim 34 wherein the disorder is related to cell signal processing and metabolic pathway modulation.
37. The method of claim 34, wherein the subject is a human.
38. A pharmaceutical composition comprising the polypeptide of claim 1 and a pharmaceutically-acceptable carrier.
39. A pharmaceutical composition comprising the nucleic acid molecule of claim 5 and a pharmaceutically-acceptable carrier.
40. A pharmaceutical composition comprising the antibody of claim 15 and a pharmaceutically-acceptable carrier.
41. A kit comprising in one or more containers, the pharmaceutical composition of claim 38.
42. A kit comprising in one or more containers, the pharmaceutical composition of claim 39.

43. A kit comprising in one or more containers, the pharmaceutical composition of claim 40.
44. A method for determining the presence of or predisposition to a disease associated with altered levels of the polypeptide of claim 1 in a first mammalian subject, the method comprising:
- (a) measuring the level of expression of the polypeptide in a sample from the first mammalian subject; and
  - (b) comparing the amount of said polypeptide in the sample of step (a) to the amount of the polypeptide present in a control sample from a second mammalian subject known not to have, or not to be predisposed to, said disease;
- wherein an alteration in the expression level of the polypeptide in the first subject as compared to the control sample indicates the presence of or predisposition to said disease.
45. The method of claim 44 wherein the predisposition is to a cancer.
46. A method for determining the presence of or predisposition to a disease associated with altered levels of the nucleic acid molecule of claim 5 in a first mammalian subject, the method comprising:
- (a) measuring the amount of the nucleic acid in a sample from the first mammalian subject; and
  - (b) comparing the amount of said nucleic acid in the sample of step (a) to the amount of the nucleic acid present in a control sample from a second mammalian subject known not to have or not be predisposed to, the disease;
- wherein an alteration in the level of the nucleic acid in the first subject as compared to the control sample indicates the presence of or predisposition to the disease.
47. The method of claim 46 wherein the predisposition is to a cancer.
48. A method of treating a pathological state in a mammal, the method comprising administering to the mammal a polypeptide in an amount that is sufficient to alleviate the pathological state, wherein the polypeptide is a polypeptide having an amino acid sequence at least 95% identical to a polypeptide comprising an amino acid sequence of at least one of SEQ ID NOS:2n, wherein n is an integer between 1 and 162, or a biologically active fragment thereof.

49. A method of treating a pathological state in a mammal, the method comprising administering to the mammal the antibody of claim 15 in an amount sufficient to alleviate the pathological state.

(54) Title: PROTEINS AND NUCLEIC ACIDS ENCODING SAME

(57) Abstract: Disclosed herein are nucleic acid sequences that encode novel polypeptides. Also disclosed are polypeptides encoded by these nucleic acid sequences, and antibodies, which immunospecifically-bind to the polypeptide, as well as derivatives, variants, mutants, or fragments of the aforementioned polypeptide, polynucleotide, or antibody. The invention further discloses therapeutic, diagnostic and research methods for diagnosis, treatment, and prevention of disorders involving any one of these novel human nucleic acids and proteins.

# INTERNATIONAL SEARCH REPORT

International Application No

PCT/US 02/02785

## A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 C12N15/12 C07K14/47 C07K16/18 C12Q1/68 A61K38/00  
A61K38/17

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 C12N C07K C12Q A61K

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, BIOSIS, MEDLINE, EMBASE, SEQUENCE SEARCH, WPI Data, PAJ

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

| Category * | Citation of document, with indication, where appropriate, of the relevant passages                                                                                                                                                                                                                                                               | Relevant to claim No. |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| X          | KEEN JEFFREY ET AL: "Characterisation of the human claudin gene family reveals a complex evolutionary history."<br>EUROPEAN JOURNAL OF HUMAN GENETICS, vol. 8, no. ☒ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

### \* Special categories of cited documents:

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "E" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- "&" document member of the same patent family

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 02/02785

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:  
  
Although claims 26-37, 48 and 49 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☒ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:  
  
in part: 1-49;

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

Invention 1; Claims: in part: 1-49; all as far as applicable.

A polypeptide designated NOVX1 and defined by the SEQ ID NOs in Table A; nucleic acids encoding said polypeptide; variants of said polypeptide and said nucleic acids; a vector comprising said nucleic acids; a cell comprising said vector; an antibody against said polypeptide; methods for determining the presence or amount of said polypeptide or said nucleic acids; a method for identifying an agent which binds to said polypeptide; a method for identifying an agent that modulates the expression or activity of said polypeptide; a method for modulating the activity of said polypeptide; methods of treatment or prevention using said polypeptide, or said nucleic acid, or said antibody; pharmaceutical compositions comprising said polypeptide, or said nucleic acids, or said antibody; kits comprising said pharmaceutical compositions; methods for determining the presence of or the predisposition to a disease by measuring the level of said polypeptide or said nucleic acid.

Inventions 2-99; Claims: in part: 1-49; all as far as applicable

Idem as invention 1 but limited to subject-matter relating to NOVX2-99; wherein  
invention 2 is limited to NOVX2 (as defined in Table A),  
invention 3 is limited to NOVX3 (as defined in Table A),  
etc...  
invention 99 is limited to NOVX99 (as defined in Table A).
